When preparing to take the Certificate of Cloud Security Knowledge v5 (CCSKv5.0) (CCSK) exam dumps, knowing where to start can be a little frustrating, but with PassExamDumps Cloud Security Alliance CCSK practice questions, you will feel fully prepared. Using our Cloud Security Alliance CCSK practice test software, you can prepare for the increased difficulty on Cloud Security Alliance CCSK Exam day. Plus, we have various question types and difficulty levels so that you can tailor your Certificate of Cloud Security Knowledge v5 (CCSKv5.0) (CCSK) exam dumps preparation to your requirements.

The CCSK certification exam is intended for IT professionals, security professionals, and risk management professionals who are interested in developing their knowledge and expertise in cloud computing security. CCSK exam is specifically designed to test an individual's knowledge of cloud computing security principles, techniques, and best practices, as well as their ability to apply this knowledge in real-world scenarios. CCSK exam covers a wide range of topics, including cloud infrastructure security, cloud application security, data security, virtualization security, and compliance and legal issues related to cloud computing.

Cloud Security Alliance CCSK Exam Certification Details:

Exam Code	CCSK
Exam Price	$395 USD

Exam Name	CSA Certificate of Cloud Security Knowledge (CCSK Foundation)
Schedule Exam	PEARSON VUE

100% Pass Quiz 2026 Cloud Security Alliance High Hit-Rate Valid CCSK Exam Syllabus

The platform offers three distinct formats, including a desktop-based Cloud Security Alliance CCSK practice test software, a web-based practice test, and a convenient PDF format. This allows candidates to choose the format that best suits their learning style and preference, ensuring a seamless and effective exam preparation experience. By offering tailored solutions to meet individual needs, PassExamDumps has established itself as a trusted provider of top-quality Certificate of Cloud Security Knowledge v5 (CCSKv5.0) (CCSK) exam preparation material.

Cloud Security Alliance Certificate of Cloud Security Knowledge v5 (CCSKv5.0) Sample Questions (Q147-Q152):

NEW QUESTION # 147
Cloud Security provider is responsible for Platform Security in Platform as a Service(PaaS) model.

- A. True
- B. False

Answer: B

Explanation:
It is false. Platform security is a shared responsibility between cloud service provider and cloud service customer in Platform as a Service(PaaS) model.

NEW QUESTION # 148
Which aspect of a Cloud Service Provider's (CSPs) infrastructure security involves protecting the interfaces used to manage configurations and resources?

- A. Management plane
- B. PaaS/SaaS services
- C. Virtualization layers
- D. Physical components

Answer: A

Explanation:
The management plane refers to the interfaces used to manage configurations and resources in a cloud environment. It is responsible for handling administrative tasks, such as provisioning, configuration management, and monitoring of resources. Protecting the management plane is crucial because it is where sensitive configurations and access control policies are set, which can potentially be exploited if not properly secured.
Securing the management plane involves ensuring that only authorized users and systems can make changes to the cloud infrastructure and resources, protecting these interfaces from unauthorized access or malicious activity.

NEW QUESTION # 149
How should an SDLC be modified to address application security in a Cloud Computing environment?

- A. No modification is needed
- B. Integrated development environments
- C. Just-in-time compilers
- D. Both B and C

- E. Updated threat and trust models

Answer: B

NEW QUESTION # 150

Which technique is most effective for preserving digital evidence in a cloud environment?

- A. Taking snapshots of virtual machines
- B. Isolating the compromised system
- C. Analyzing management plane logs
- D. Regularly backing up data

Answer: A

Explanation:
Taking snapshots of virtual machines (VMs) is one of the most effective techniques for preserving digital evidence in a cloud environment. Snapshots capture the entire state of a VM, including its memory, configuration, and disk contents at a particular point in time. This allows investigators to preserve evidence as it was at the moment of the incident, enabling detailed analysis without altering the original state of the system.
While isolating the compromised system is important to prevent further damage, snapshots are more directly useful for preserving evidence. Backing up data and analyzing management plane logs are also valuable for incident response, but they don't capture the complete state of a compromised system as effectively as snapshots do.

NEW QUESTION # 151

Which practice best helps mitigate security risks by minimizing root/core access and restricting deployment creation?

- A. Deploying applications with full access and applying restrictions based on the need to object
- B. Enforcing the principle of least privilege
- C. Disabling multi-factor authentication for staff and focusing on decision makers' accounts
- D. Enforcing the principle of trust and eventually verily on demand'

Answer: B

Explanation:
Enforcing the principle of least privilege is the practice of granting users and systems the minimum level of access necessary to perform their tasks. By limiting root or core access and restricting the creation of deployments to only those who absolutely need it, the risk of unauthorized access, misuse, or damage is minimized. This helps ensure that critical systems and sensitive data are protected by reducing the number of people or services with high-level access.
Trust and verify on demand is not a standard security practice and could create security gaps. Disabling multi- factor authentication is a poor security practice, as multi-factor authentication (MFA) enhances security by adding an additional layer of verification. Deploying applications with full access) contradicts the principle of least privilege and could expose the system to unnecessary risks.
