Snowflake SnowPro Advanced Architect Certification Sample Questions (Q147-Q152):

NEW QUESTION # 147

For which use cases, will you use cross-cloud and cross-region replication?

- A. Business continuity and disaster recovery
- B. Secure data sharing across regions/cloud
- C. Data portability and account migrations
- D. All of these

Answer: D

NEW QUESTION # 148

An Architect is integrating an application that needs to read and write data to Snowflake without installing any additional software on the application server.

How can this requirement be met?

- A. Use the Snowflake ODBC driver.
- B. Use the Snowpipe REST API.
- C. Use the Snowflake SQL REST API.
- D. Use SnowSQL.

Answer: C

Explanation:

The Snowflake SQL REST API is a REST API that you can use to access and update data in a Snowflake database. You can use this API to execute standard queries and most DDL and DML statements. This API can be used to develop custom applications and integrations that can read and write data to Snowflake without installing any additional software on the application server.

Option A is not correct because SnowSQL is a command-line client that requires installation and configuration on the application server. Option B is not correct because the Snowpipe REST API is used to load data from cloud storage into Snowflake tables, not to read or write data to Snowflake. Option D is not correct because the Snowflake ODBC driver is a software component that enables applications to connect to Snowflake using the ODBC protocol, which also requires installation and configuration on the application server. References: The answer can be verified from Snowflake's official documentation on the Snowflake SQL REST API available on their website. Here are some relevant links:

NEW QUESTION # 149

What are some of the characteristics of result set caches? (Choose three.)

- A. Each time persisted results for a query are used, a 24-hour retention period is reset.
- B. The retention period can be reset for a maximum of 31 days.
- C. The data stored in the result cache will contribute to storage costs.
- D. Time Travel queries can be executed against the result set cache.
- E. Snowflake persists the data results for 24 hours.
- F. The result set cache is not shared between warehouses.

Answer: A,B,E

Explanation:

Comprehensive and Detailed Explanation: According to the SnowPro Advanced: Architect documents and learning resources, some of the characteristics of result set caches are:

- * Snowflake persists the data results for 24 hours. This means that the result set cache holds the results of every query executed in the past 24 hours, and can be reused if the same query is submitted again and the underlying data has not changed.
- * Each time persisted results for a query are used, a 24-hour retention period is reset. This means that the result set cache extends

the lifetime of the results every time they are reused, up to a maximum of 31 days from the date and time that the query was first executed¹.

* The retention period can be reset for a maximum of 31 days. This means that the result set cache will purge the results after 31 days, regardless of whether they are reused or not. After 31 days, the next time the query is submitted, a new result is generated and persisted¹.

The other options are incorrect because they are not characteristics of result set caches. Option A is incorrect because Time Travel queries cannot be executed against the result set cache. Time Travel queries use the AS OF clause to access historical data that is stored in the storage layer, not the result set cache². Option D is incorrect because the data stored in the result set cache does not contribute to storage costs. The result set cache is maintained by the service layer, and does not incur any additional charges¹. Option F is incorrect because the result set cache is shared between warehouses. The result set cache is available across virtual warehouses, so query results returned to one user are available to any other user on the system who executes the same query, provided the underlying data has not changed¹. NEW QUESTION # 150

An Architect is designing a file ingestion recovery solution. The project will use an internal named stage for file storage. Currently, in the case of an ingestion failure, the Operations team must manually download the failed file and check for errors.

Which downloading method should the Architect recommend that requires the LEAST amount of operational overhead?

- A. Use the get command in SnowSQL to retrieve the file.
- B. Use the Snowflake Connector for Python, connect to remote storage and download the file.
- C. Use the Snowflake API endpoint and download the file.
- D. Use the get command in Snowsight to retrieve the file.

Answer: A

Explanation:

The get command in SnowSQL is a convenient way to download files from an internal stage to a local directory. The get command can be used in interactive mode or in a script, and it supports wildcards and parallel downloads. The get command also allows specifying the overwrite option, which determines how to handle existing files with the same name². The Snowflake Connector for Python, the Snowflake API endpoint, and the get command in Snowsight are not recommended methods for downloading files from an internal stage, because they require more operational overhead than the get command in SnowSQL. The Snowflake Connector for Python and the Snowflake API endpoint require writing and maintaining code to handle the connection, authentication, and file transfer. The get command in Snowsight requires using the web interface and manually selecting the files to download^{3,4}. References:

NEW QUESTION # 151

Which of the following are characteristics of Snowflake's parameter hierarchy?

- A. Virtual warehouse parameters override user parameters.
- B. Session parameters override virtual warehouse parameters.
- C. Schema parameters override account parameters.
- D. Table parameters override virtual warehouse parameters.

Answer: A

Explanation:

In Snowflake's parameter hierarchy, virtual warehouse parameters take precedence over user parameters. This hierarchy is designed to ensure that settings at the virtual warehouse level, which typically reflect the requirements of a specific workload or set of queries, override the preferences set at the individual user level. This helps maintain consistent performance and resource utilization as

specified by the administrators managing the virtual warehouses.
