## CISSP EXAM Questions And Answers (100% Guaranteed Success)

1. Which of the following best describes the relationship between COBIT and ITIL?  
A. COBIT is a model for IT governance, whereas ITIL is a model for corporate governance.  
B. COBIT provides a corporate governance roadmap, whereas ITIL is a customizable framework for IT service management.  
C. COBIT defines IT goals, whereas ITIL provides the process-level steps on how to achieve them.  
D. COBIT provides a framework for achieving business goals, whereas ITIL defines a framework for achieving IT service-level goals. CORRECT ANSWERS C. The Control Objectives for Information and related Technology (COBIT) is a framework developed by ISACA (formerly the Information Systems Audit and Control Association) and the IT Governance Institute (ITGI). It defines goals for the controls that should be used to properly manage IT and to ensure IT maps to business needs, not specifically just security needs. The Information Technology Infrastructure Library (ITIL) is the de facto standard of best practices for IT service management. A customizable framework, ITIL provides the goals, the general activities necessary to achieve these goals, and the input and output values for each process required to meet these determined goals. In essence, COBIT addresses "what is to be achieved," and ITIL addresses "how to achieve it."
2. Global organizations that transfer data across international boundaries must abide by guidelines and transborder information flow rules developed by an international organization that helps different governments come together and tackle the economic, social, and governance challenges of a globalized economy. What organization is this?  
A. Committee of Sponsoring Organizations of the Treadway Commission  
B. The Organisation for Economic Co-operation and Development  
C. COBIT  
D. International Organization for Standardization CORRECT ANSWERS B. Almost every country has its own rules pertaining to what constitutes private data and how it should be protected. As the digital and information age came upon us, these different laws started to negatively affect business and international trade. Thus, the Organisation for Economic Co-operation and Development (OECD) developed guidelines for various countries so that data is properly protected and everyone follows the same rules.
3. Steve, a department manager, has been asked to join a committee that is responsible for defining an acceptable level of risk for the organization, reviewing risk assessment and audit reports, and approving significant changes to security policies and programs. What committee is he joining?

## ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q522-Q527):

### NEW QUESTION # 522

Refer to the information below to answer the question.

During the investigation of a security incident, it is determined that an unauthorized individual accessed a system which hosts a database containing financial information.

If the intrusion causes the system processes to hang, which of the following has been affected?

- A. System auditability
- B. System integrity
- C. System availability
- D. System confidentiality

**Answer: C**

### NEW QUESTION # 523

How does identity as a service (IDaaS) provide an easy mechanism for integrating identity service into individual applications with minimal development effort?

- A. By allowing for internal provisioning of user accounts
- B. By keeping all user information in easily accessible cloud repositories
- C. By allowing the identification logic and storage of an identity's attributes to be maintained externally
- D. By integrating internal provisioning procedures with external authentication processes

**Answer: C**

Explanation:

Identity as a service (IDaaS) is a cloud-based solution that provides identity and access management (IAM) services to customers, either on-premise or in the cloud. IDaaS offers an easy mechanism for integrating identity service into individual applications with minimal development effort by allowing the identification logic and storage of an identity's attributes to be maintained externally by the IDaaS provider. This way, the applications can leverage the IDaaS provider's APIs and protocols to authenticate and authorize users, without having to implement their own identity infrastructure or store user credentials locally. IDaaS can also provide other benefits, such as scalability, availability, cost-effectiveness, compliance, and security.

### NEW QUESTION # 524

What is the MOST important element when considering the effectiveness of a training program for Business Continuity (BC) and Disaster Recovery (DR)?

- A. Target audience
- B. Technology used for delivery
- C. Consideration of organizational need
- D. Management support

**Answer: D**

Explanation:

Section: Software Development Security

### NEW QUESTION # 525

What is the proper term to refer to a single unit of IP data?

- A. IP segment.
- B. IP frame.
- C. IP datagram.
- D. IP fragment.

**Answer: C**

Explanation:

IP is a datagram based technology.

DIFFERENCE BETWEEN PACKETS AND DATAGRAM

As specified at: [http://en.wikipedia.org/wiki/Packet\\_\(information\\_technology\)](http://en.wikipedia.org/wiki/Packet_(information_technology))

In general, the term packet applies to any message formatted as a packet, while the term datagram is generally reserved for packets of an "unreliable" service.

A "reliable" service is one that notifies the user if delivery fails, while an "unreliable" one does not notify the user if delivery fails. For example, IP provides an unreliable service.

Together, TCP and IP provide a reliable service, whereas UDP and IP provide an unreliable one.

All these protocols use packets, but UDP packets are generally called datagrams.

If a network does not guarantee packet delivery, then it becomes the host's responsibility to provide reliability by detecting and retransmitting lost packets. Subsequent experience on the ARPANET indicated that the network itself could not reliably detect all packet delivery failures, and this pushed responsibility for error detection onto the sending host in any case. This led to the development of the end-to-end principle, which is one of the Internet's fundamental design

assumptions.

The following answers are incorrect:

IP segment. Is incorrect because IP segment is a detractor, the correct terminology is TCP segment. IP is a datagram based technology.

IP frame. Is incorrect because IP frame is a detractor, the correct terminology is Ethernet frame. IP is a datagram based technology.

IP fragment. Is incorrect because IP fragment is a detractor.
