dbt Labs dbt Analytics Engineering Certification Exam Sample Questions (Q53-Q58):

NEW QUESTION # 53

You want to include a detailed lineage diagram in your project documentation. Which of these approaches would you likely consider?

- A. Use the built-in lineage functionality within dbt's standard documentation generation.
- B. **Configure a third-party dbt package designed for enhanced lineage and visualization.**
- C. Manually create a diagram using a separate tool and add an image reference in a model's description.
- D. Write a custom macro that generates a lineage diagram and include it in relevant model descriptions.

Answer: B,C,D

Explanation:

A: For basic needs, a manual approach might be sufficient C: Custom macros provide flexibility in how the lineage is presented. D: Specialized packages offer advanced lineage visualization capabilities-

NEW QUESTION # 54

Your team establishes a policy for handling different levels of test failures (e.g., warnings vs. critical errors). How could you implement this policy effectively within your dbt workflows?

- A. Use custom severity levels in your test definitions and a post-hook to manage actions accordingly.
- B. Use dbt tags for classifying tests, then selectively execute them.
- C. Rely on your data observability platform to differentiate and alert based on dbt test results.
- D. Run dbt test multiple times with varying filters based on desired severity levels.

Answer: A,B,C

Explanation:

Each provides a mechanism to act upon varying severity levels A leverages dbt's built-in features- C integrates with external monitoring tools. D offers flexible execution control.

NEW QUESTION # 55

You implement dbt tests to monitor data quality over time. Which of the following scenarios could these tests potentially help you detect?

- A. Gradual degradation in source data completeness due to an API rate limit being reached
- B. An unexpected spike in web traffic leading to invalid data entries in your source system-
- C. An accidental schema change by someone working outside of your dbt project-
- D. Performance issues in your data warehouse impacting the speed of dbt model updates.

Answer: A,B,C

Explanation:

A, C, and D relate to the changing quality of the data itself, which tests can surface. B (warehouse performance) is a separate issue.

NEW QUESTION # 56

You're working with a development data warehouse meant to closely mirror production. To make code more portable between environments, you opt to use environment variables for connection details. What's the best way to manage these?

- A. Define environment variables as part of your CI/CD tool's job configuration.
- B. Use a dedicated secrets manager integrated with your dbt project.
- C. Set environment variables manually in your shell session prior to running dbt commands.
- D. Store sensitive credentials in plain text in the dbt_project.yml file, relying on file system permissions.

Answer: A,B

Explanation:

B provides the most secure and easily auditable solution. D is essential for automating deployments. A is insecure practice. C is cumbersome and error-prone.

NEW QUESTION # 57

Examine the configuration for the source:

sources:

```
- name: jaffle_shop
  schema: jaffle_shop_raw_current
```

tables:

```
- name: orders
  identifier: customer_orders
```

Which reference to the source is correct?

- A. {{ source('jaffle_shop', 'customer_orders') }}
- B. {{ source('jaffle_shop_raw_current', 'orders') }}
- C. {{ source('jaffle_shop_raw_current', 'customer_orders') }}
- D. {{ source('jaffle_shop', 'orders') }}

Answer: D

Explanation:

In dbt, the source() function resolves a source by its declared source name and table name, not by the physical schema or identifier in the warehouse. The YAML block defines a source named jaffle_shop, and under that source, a table named orders. The identifier: customer_orders field tells dbt that although the logical table name is orders, the actual physical object in the warehouse is named customer_orders.

dbt always expects the syntax:

```
{{ source(source_name, table_name) }}
```

Here, the correct reference uses jaffle_shop as the source name and orders as the table name because these are the logical names assigned in the YAML. dbt internally resolves the physical table name via the identifier field, so the model should not reference customer_orders directly.

Option A and B are incorrect because the first argument is not the schema; dbt does not use schemas in the source() call. Option D is incorrect because customer_orders is the warehouse identifier, not the logical table name recognized by dbt.

Therefore, the correct reference is:

```
{{ source('jaffle_shop', 'orders') }}
```

This ensures consistent modeling, dependency tracking, and accurate documentation.
