최신 Oracle Cloud Infrastructure 1Z0-1195-25 무료샘플문제 (Q28-Q33):

질문 # 28

Supply Side is data that is passive and means something. What two models and libraries are included in the supply side?

- A. Reports
- B. Business rules
- C. Domain objects
- D. Technical definitions of business terms

정답: B,C

설명:

In the Oracle Data Platform, the "Supply Side" refers to foundational data elements that are passively collected and structured to provide meaning within the data ecosystem. According to Oracle's official documentation, the supply side includes "Business rules" (A), which define the logic and policies governing data usage, ensuring consistency and compliance, and "Domain objects" (B), which represent structured entities or concepts within a business domain, forming the backbone of data modeling. "Technical definitions of business terms" (C) pertain to metadata management, and "Reports" (D) are outputs rather than core supply-side models. Oracle's Data Platform Foundations emphasize business rules and domain objects as key components of the supply side for data integration and processing.

질문 # 29

Oracle Data Lakehouse streamlines the integration, storage, and processing of data. Which two services are used for persistence of the data in Lakehouse?

- A. OCI GoldenGate
- B. Autonomous Database
- C. OCI Data Catalog

- **D. OCI Object Storage**

정답: B,D

설명:

In Oracle's Data Lakehouse architecture, data persistence refers to the storage layer where data is durably maintained. "Autonomous Database" (B) provides a managed, self-tuning relational database for structured data persistence, supporting SQL-based workloads. "OCI Object Storage" (D) offers scalable, durable storage for unstructured and semi-structured data, such as files, images, and logs, serving as the data lake component of the Lakehouse. "OCI Data Catalog" (A) is a metadata management service, not a persistence layer, and "OCI GoldenGate" (C) handles data replication and integration, not direct storage. Oracle's Lakehouse documentation identifies Autonomous Database and OCI Object Storage as the primary persistence services.

질문 # 30

What is the FINAL release supporting the non-CDB architecture?

- A. Oracle Database 23c
- B. Oracle Database 18c
- **C. Oracle Database 19c**
- D. Oracle Database 21c

정답: C

설명:

The final release supporting the "non-CDB (non-Container Database)" architecture is "Oracle Database 19c" (B). Oracle deprecated the non-CDB architecture starting with 20c (never fully released) and mandated the multitenant architecture (CDB with PDBs) from 21c onward. 19c, as a long-term support release, was the last to support non-CDB databases, with Oracle recommending migration to multitenant in subsequent versions like 23c. Oracle's documentation confirms 19c as the end of non-CDB support.

질문 # 31

Which two actions can be performed from the OCI Console for an Oracle Autonomous Database?

- **A. Increase Storage allocated for Database**
- B. Increase Network Bandwidth
- C. Scale up/down Memory
- **D. Scale up/down CPU**

정답: A,D

설명:

From the OCI Console for an "Oracle Autonomous Database," you can "Scale up/down CPU" (A) to adjust compute resources dynamically and "Increase Storage allocated for Database" (D) to expand capacity, both with no downtime. "Increase Network Bandwidth" (B) is not a console-adjustable parameter (managed by Oracle), and "Scale up/down Memory" (C) is not independently configurable (tied to CPU scaling). Oracle's documentation confirms CPU and storage scaling as user-controlled actions.

질문 # 32

How does the Converged Database help to access data using an API?

- A. Developers can point their application to the location of ADB Wallet which integrates all REST API calls
- B. The database provides only one universal REST interface which makes integration of applications extremely agile
- C. Each database comes with a REST-enabled compute instance to provide access to data
- **D. A REST API is automatically generated on top of SQL or stored procedures**

정답: D

설명:

The "Converged Database" facilitates API access by "A REST API is automatically generated on top of SQL or stored procedures" (B), using Oracle REST Data Services (ORDS). This allows developers to expose database logic as RESTful endpoints without

manual coding. Option A is incorrect, as no separate compute instance is provided. Option C oversimplifies, as multiple REST interfaces can be created, not just one. Option D misrepresents the ADB Wallet's role, which is for security, not API generation. Oracle's documentation highlights ORDS auto-generation as a converged feature.
