AWS-Certified-Developer-Associate exam fee is \$150, and candidates can retake the exam after 14 days if they do not pass on their first attempt.

Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q234-Q239):

NEW QUESTION # 234

A Developer has published an update to an application that is served to a global user base using Amazon CloudFront. After deploying the application, users are not able to see the updated changes.

How can the Developer resolve this issue?

- A. Remove the origin from the CloudFront configuration and add it again.
- **B. Invalidate all the application objects from the edge caches.**
- C. Disable the CloudFront distribution and enable it again to update all the edge locations.
- D. Disable forwarding of query strings and request headers from the CloudFront distribution configuration.

Answer: B

NEW QUESTION # 235

A user is trying to configure access with S3. Which of the following options is not possible to provide access to the S3 bucket / object?

- A. Define the ACL for the object
- **B. Define the policy for the object**
- C. Define the policy for the IAM user
- D. Define the policy for the bucket

Answer: B

Explanation:

Amazon S3 offers access policy options broadly categorized as resource-based policies and user policies. Access policies, such as ACL and resource policy can be attached to the bucket. With the object the user can only have ACL and not an object policy. The user can also attach access policies to the IAM users in the account. These are called user policies.

NEW QUESTION # 236

An application displays a status dashboard. The status is updated by 1 KB messages from an SQS queue.

Although the status changes infrequently, the Developer must minimize the time between the message arrival in the queue and the dashboard update.

What technique provides the shortest delay in updating the dashboard?

- A. Reduce the size of each message payload by sending it in two parts.
- B. Retrieve the messages from the queue using short polling every 10 seconds.
- **C. Retrieve the messages from the queue using long polling every 20 seconds.**
- D. Reduce the size of the messages by compressing them before sending.

Answer: C

Explanation:

Explanation

NEW QUESTION # 237

To meet new data compliance requirements, a company needs to keep critical data durably stored and readily accessible for 7 years. Data that is more than 1 year old is considered archival data and must automatically be moved out of the Amazon Aurora MySQL DB cluster every week. On average, around 10 GB of new data is added to the database every month. A database specialist must choose the most operationally efficient solution to migrate the archival data to Amazon S3.

Which solution meets these requirements?

- A. Configure an AWS Lambda function that exports archival data from the DB cluster to Amazon S3 using a SELECT INTO OUTFILE S3 statement, then deletes the archival data from the DB cluster. Schedule the Lambda function to run weekly using Amazon EventBridge (Amazon CloudWatch Events).
- B. Use AWS Database Migration Service (AWS DMS) to continually export the archival data from the DB cluster to Amazon S3. Configure an AWS Data Pipeline process to run weekly that executes a custom SQL script to delete the archival data from the DB cluster.
- C. Configure two AWS Lambda functions: one that exports archival data from the DB cluster to Amazon S3 using the `mysqldump` utility, and another that deletes the archival data from the DB cluster. Schedule both Lambda functions to run weekly using Amazon EventBridge (Amazon CloudWatch Events).
- D. Create a custom script that exports archival data from the DB cluster to Amazon S3 using a SQL view, then deletes the archival data from the DB cluster. Launch an Amazon EC2 instance with a weekly cron job to execute the custom script.

Answer: C

NEW QUESTION # 238

A user has created an EBS volume with 1000 IOPS. What is the average IOPS that the user will get for most of the year as per EC2 SLA if the instance is attached to the EBS optimized instance?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: B

Explanation:

As per AWS SLA if the instance is attached to an EBS-Optimized instance, then the Provisioned IOPS volumes are designed to deliver within 10% of the provisioned IOPS performance 99.9% of the time in a given year. Thus, if the user has created a volume of 1000 IOPS, the user will get a minimum 900 IOPS 99.9% time of the year.
