NEW QUESTION # 411

Refer to the exhibit. The user experiences random packet drops when accessing Server-1 but does not have any issues when reaching out to Server-2. Which action resolves the issue?

- A. Remove the distance 10 under the OSPF process on R1.
- B. Configure the distance under the EIGRP process to 10 on R2.
- C. Modify the distance 10 under the OSPF process on R1 to 90.
- D. Configure the distance under the EIGRP process to 10 on R1.

Answer: A

Explanation:

In the provided configuration, R1 has a modified OSPF administrative distance set to 10. By default, OSPF has an administrative distance of 110, and EIGRP has an administrative distance of 90. Lowering OSPF's distance to 10 makes OSPF routes preferred over EIGRP routes, potentially causing suboptimal routing and packet drops when accessing Server-1.

By removing the distance 10 under the OSPF process on R1, the default OSPF administrative distance of 110 is restored, and EIGRP routes (AD 90) will take precedence as intended, resolving the routing issue.
