NEW QUESTION # 361
During a brainstorming session, a project team is elaborating on what caused the unexpected crash of the website that the team was developing. Given the following:

Which of the following was the initial cause of the issue?

- A. Inadequate memory
- B. Incorrect configuration
- C. Inadequate instructions
- D. Lack of infrastructure

Answer: B

Explanation:
Incorrect configuration was the initial cause of the issue that caused the unexpected crash of the website that the team was developing. The diagram given is an example of a fishbone diagram or a cause-and-effect diagram that shows the possible causes of a problem or effect. The diagram has four main categories: people, process, technology, and environment. Each category has subcategories that list specific factors that may contribute to the problem or effect. The diagram shows that incorrect configuration under technology was marked as an initial cause of website crash.

NEW QUESTION # 362
A business analyst has gathered information directly from the client and is currently working with the project manager to identify what to include in the document in order to finish it. Which of the following processes should the project manager do next?

- A. Validate the scope.
- B. Collect the requirements.
- C. Create the work breakdown structure.
- D. Define the scope.

Answer: B

Explanation:
This is the process of gathering information directly from the client and other stakeholders to define what needs to be done in order to deliver the project outcomes. Reference = CompTIA Project+ Study Guide1, Chapter 9: Scope Management According to the CompTIA Project+ Study Guide1, scope management is the process of defining, validating, and controlling the project scope throughout the project life cycle. Scope management involves identifying and documenting the project requirements, creating a work breakdown structure (WBS), and managing changes to the scope.

NEW QUESTION # 363

Which of the following offers administrators more direct control over operating systems?

- A. Software as a service
- B. Infrastructure as a service
- C. Platform as a service
- D. Functions as a service

Answer: B

Explanation:

Infrastructure as a service (IaaS) offers administrators more direct control over operating systems than other cloud service models. IaaS is a type of cloud computing service that provides virtualized computing resources such as servers, storage, network, and operating systems over the internet. IaaS allows users to rent or lease infrastructure resources on demand and pay only for what they use. IaaS gives users more flexibility and control over their infrastructure resources and enables them to configure, manage, and customize their operating systems according to their needs and preferences3

NEW QUESTION # 364

During a status meeting for a multisystem program, a program manager learns that some deliverables from another project are delayed. Which of the following should the program manager do next?

- A. Apply contingency reserves.
- B. Update the critical path for the project.
- C. Reestimate epic user stories.
- D. Obtain details from the owner of the project.

Answer: D

Explanation:

The program manager should first obtain details from the owner of the project that is causing the delay, such as the root cause, the impact, the mitigation plan, and the revised timeline. This will help the program manager to assess the situation, communicate with the stakeholders, and adjust the program schedule accordingly. Updating the critical path, applying contingency reserves, and reestimating epic user stories are possible actions that the program manager may take after obtaining the details, depending on the severity and duration of the delay. However, they are not the immediate next steps, as they require more information and analysis. NEW QUESTION # 365

A project is executed to migrate all data to a single system following the merger of two companies. The team validates that system performance will not be impacted. Which of the following did the team perform?

- A. Regression testing
- B. Automation testing
- C. Smoke testing
- D. Stress testing

Answer: D

Explanation:

Stress testing is a type of performance testing that evaluates how a system behaves under extreme load conditions, such as high volume of data, concurrent users, or transactions12. Stress testing can help to identify the system's breaking point, bottlenecks, and resource limitations, and to ensure that the system can recover from failures and maintain its functionality34. In this case, the team performed stress testing to validate that system performance will not be impacted by migrating all data to a single system following the merger of two companies. This implies that the team simulated a high amount of data transfer and processing, and measured the system's response time, throughput, availability, and reliability under such load. Stress testing is better than the other options because:

Regression testing is a type of functional testing that verifies that a system's existing features and functionality are not affected by a change or an update56. Regression testing does not focus on system performance or load conditions, but rather on system correctness and quality.

Smoke testing is a type of functional testing that checks the basic functionality and stability of a system before performing more

detailed and comprehensive testing78. Smoke testing does not measure system performance or load conditions, but rather ensures that the system is ready for further testing.

Automation testing is a technique of using software tools or scripts to execute test cases and compare the actual results with the expected results910. Automation testing is not a specific type of testing, but rather a way of performing testing. Automation testing can be applied to various types of testing, including stress testing, regression testing, and smoke testing.
