Splendid PAP-001 Exam Materials: Certified Professional - PingAccess Present You a brilliant Training Dump - TrainingQuiz

Just choose the right Ping Identity PAP-001 exam questions format demo and download it quickly. Download the TrainingQuiz Ping Identity PAP-001 exam questions demo now and check the top features of TrainingQuiz Ping Identity PAP-001 Exam Questions. If you think the TrainingQuiz Ping Identity PAP-001 exam dumps can work for you then take your buying decision. Best of luck in exams and career!!!

Ping Identity Certified Professional - PingAccess Sample Questions (Q48-Q53):

NEW QUESTION # 48

An application requires MFA for URLs that are considered high risk. Which action should the administrator take to meet this requirement?

- A. Apply an HTTP Request Parameter rule to the resource.
- B. Create an Authentication Requirement named MFA_Required.
- **C. Apply an Authentication Requirements rule to the resource.**
- D. Apply a Web Session Attribute rule to the resource.

Answer: C

Explanation:

PingAccess allows fine-grained authentication enforcement by applying Authentication Requirement rules at the resource level. These rules can invoke MFA flows based on request context or policy.

Exact Extract:

"Authentication requirement rules determine whether PingAccess challenges a user to authenticate again (for example, with MFA) before allowing access to a protected resource."

- * Option A is incomplete. Creating a requirement does nothing unless it is applied.
- * Option B is correct because applying the Authentication Requirement rule to the specific resource (URL) enforces MFA only for that resource.
- * Option C is incorrect; Web Session Attribute rules are about evaluating existing session attributes, not triggering MFA.
- * Option D is incorrect; HTTP Request Parameter rules are used to evaluate request data, not enforce MFA policies.

NEW QUESTION # 49

An auto parts company wants to protect the path/parts/suspension/struts/manufacturer. Resources appear under an applicationContext Root of parts with default ordering.

Which resource will the policy engine select?

- A. //manufacturer
- **B. /suspension/struts/manufacturer**
- C. //struts/manufacturer
- D. //manufacturer

Answer: B

Explanation:

Because the application context root is /parts, resource paths are defined relative to it. The correct relative path is:

* /suspension/struts/manufacturer

Exact Extract:

"Resource matching begins at the context root. The most specific matching path is selected."

- * Option A is incorrect - /*/struts/manufacturer does not match because it starts with a wildcard, not the defined path.
- * Option B is incorrect - /*/manufacturer would match less specifically and at a different depth.
- * Option C is correct - exact match relative to /parts.
- * Option D is incorrect - too generic and not the best match.

NEW QUESTION # 50

An administrator configures PingAccess to use PingFederate as the token provider. Which benefit does this provide?

- **A. The automatic population of the Client ID field for selection in creating or editing a Web Session**
- B. The ability to define new OAuth clients in PingFederate from within PingAccess
- C. The ability to use Single Sign-On support for the administrative console and OAuth for Admin API
- D. The ability to manage token issuance criteria from within PingAccess

Answer: A

Explanation:

When PingAccess is integrated with PingFederate as a Token Provider, the OAuth clients already configured in PingFederate become available in PingAccess. This enables administrators to automatically select Client IDs when creating Web Sessions.

Exact Extract:

"When PingAccess uses PingFederate as its token provider, PingFederate OAuth clients appear automatically in PingAccess for selection during web session configuration."

- * Option A is incorrect - this refers to Admin Console authentication, which is separate.
- * Option B is incorrect - OAuth clients must be created in PingFederate, not from within PingAccess.
- * Option C is incorrect - token issuance policies are managed in PingFederate, not PingAccess.
- * Option D is correct - the Client ID dropdown is populated automatically from PingFederate.

NEW QUESTION # 51

An organization wants to take advantage of a new product feature that requires upgrading the PingAccess cluster from 7.3 to the current version. The administrator downloads the required files and places the files on the PingAccess servers. What should the administrator do next?

- A. Disable Key Rolling.
- B. Disable cluster communication.
- **C. Upgrade the Admin Console.**
- D. Upgrade the Replica Admin.

Answer: C

NEW QUESTION # 52

A financial application should be prompted for step-up authentication on a URL that allows money transfers.

A previous administrator configured rules to be applied on the required application URL. Users are not prompted for step-up authentication when accessing the/sranafemmeneyURL endpoint.

Which two actions should the administrator take? (Choose 2 answers.)

- A. Verify that a rejection handler rule exists and is applied to the application to see if a user has met the required authentication context
- **B. Verify that an authentication requirement rule is applied to the application to see if a user has met the required authentication context**
- C. Create a new identity mapping containing authentication context values and add the mapping to the existing rule
- D. Make sure that the existing rule's token validation contains the appropriate minimum authentication requirements
- **E. Make sure that the existing rule's authentication requirements contain the appropriate minimum authentication requirements**

Answer: B,E

Explanation:

Step-up authentication in PingAccess is enforced through Authentication Requirement Rules. If users are not prompted, the likely issues are:

- * The rule is missing from the application/resource.
- * The rule's minimum authentication context does not include MFA.

Exact Extract:

"Authentication requirement rules determine whether PingAccess will challenge a user with additional authentication (such as MFA). Ensure that the rule is applied to the resource and that the authentication context is set correctly."

- * Option A is incorrect - rejection handlers define error handling, not MFA enforcement.
- * Option B is correct - verify the authentication requirement rule is applied.
- * Option C is correct - ensure the rule contains the right MFA requirements.
- * Option D is incorrect - identity mappings do not enforce step-up authentication.
- * Option E is incorrect - token validation rules check validity, not MFA levels.
