## Pass Guaranteed Quiz 2026 Nutanix Updated NCP-MCA: Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Valid Learning Materials

With all this reputation, our company still take customers first, the reason we become successful lies on the professional expert team we possess, who engage themselves in the research and development of our NCP-MCA learning guide for many years. So we can guarantee that our NCP-MCA exam materials are the best reviewing material. Concentrated all our energies on the study NCP-MCA learning guide we never change the goal of helping candidates pass the exam. Our NCP-MCA test questions' quality is guaranteed by our experts' hard work. So what are you waiting for? Just choose our NCP-MCA exam materials, and you won't be regret.

## Nutanix Certified Professional - Multicloud Automation (NCP-MCA 6.10) Sample Questions (Q72-Q77):

### NEW QUESTION # 72

An administrator has Playbook that continues to fail with this error:  
failed to execute action with error: Internal Error, Maximum Memory size limit reached.  
What action are required to resolve the issue?

- A. update the Playbook action to increase the memory limit.
- B. Migrate the VM to host with Sufficient free memory.
- C. VM is already running with maximum allowed configuration,
- D. VM average memory utilization is less than 50%

**Answer: A**

Explanation:

A Playbook action has a default memory limit of 256 MB, which can be increased up to 1024 MB in the advanced settings of the action. If the action requires more memory than the limit, it will fail with the error message "Internal Error, Maximum Memory size limit reached". To resolve this issue, the administrator can edit the action and increase the memory limit to a suitable value, depending on the complexity and requirements of the action.

### NEW QUESTION # 73

Which two providers are supported in Calm? (Choose two.)

- A. GCP
- B. Kubernetes
- C. Oracle Cloud
- D. IBM Cloud

**Answer: A,B**

Explanation:

Nutanix Calm supports various providers to manage and orchestrate applications across different cloud environments. Providers are the cloud platforms or services that host the VMs or containers that run the application components. Calm supports the following providers<sup>1,2</sup>:

Nutanix AHV

VMware vSphere

AWS

Azure

GCP

Kubernetes

Bare Metal

OpenStack

Cloud-Init

Terraform

Among the options given, only Kubernetes and GCP are supported providers in Calm. Oracle Cloud and IBM Cloud are not supported providers in Calm. Reference:

1: Nutanix Calm Admin and Operations Guide<sup>3</sup>

2: Nutanix Calm Configuration and Training<sup>4</sup>

### NEW QUESTION # 74

A DevOps team is using Self-Service to manage its test environment. They want to allow developers to request the deployment of their own development VMs from the marketplace and manage day-2 operations without giving them full administrative access to Self-Service.

Which is the appropriate role to achieve this requirement?

- A. Operator
- **B. Consumer**
- C. Project Admin
- D. Developer

**Answer: B**

Explanation:

Nutanix Self-Service defines several user roles, each with specific permissions.

Documentation describes the Consumer role as:

- \* Allowed to deploy applications from the Marketplace or assigned blueprints
- \* Allowed to perform day-2 operations (power actions, snapshots, etc.)
- \* Restricted from modifying blueprints, environments, or project configurations
- \* Ideal for end users who need access to deploy and manage their workloads without administrator capabilities. This matches exactly what the DevOps team requires.

Why the other roles are incorrect

- \* Developer (A): Can modify blueprints and environments - too much privilege.
- \* Project Admin (C): Full control over project resources - far more access than needed.
- \* Operator (D): Used for automation and operational oversight, not end-user VM deployment.

Thus, Consumer (B) is the correct and intended role.

#### NEW QUESTION # 75

Which action should an administrator use to request a static IP address from an IPAM solution?

- **A. Pre-create**
- B. Guest Customization
- C. Create
- D. Profile

**Answer: A**

Explanation:

When integrating with an IP Address Management (IPAM) solution within Nutanix Calm, an administrator would use a 'Pre-create' task to request a static IP address. This task is performed before the actual creation of the VM, ensuring that the IP address is allocated and can be assigned during the VM's creation process.

Profiles (A) are used to define deployment environments, Guest Customization (C) is used for configuring the OS settings, and Create (D) is typically the task for provisioning the actual VM, not for requesting an IP.

#### NEW QUESTION # 76

Which method will result in unique names per VM when scaling out a Service in a Calm Blueprint?

- A. Call an external Python eScript that uses an IPAM API to register the VM name in DNS.
- B. Guest OS customization using sysprep contains `<ComputerName>@{@{name}}@{</ComputerName>}`.
- C. Set the VM Name field to allow user edits at launch so the user can enter a custom value at launch.
- **D. Service VM Name field contains the macro variable `@{@{calm_array_index}}@{`.**

**Answer: D**

Explanation:

The correct method to result in unique names per VM when scaling out a Service in a Calm Blueprint is to use the macro variable `@{@{calm_array_index}}@{` in the Service VM Name field (Option B). This variable will append a unique index number to each VM name based on the scale-out count. For example, if the Service VM Name is `MyAppVM-@{@{calm_array_index}}@{` and the scale-out count is 3, the resulting VM names will be `MyAppVM-0`, `MyAppVM-1`, and `MyAppVM-2`. Option A is incorrect because the `<ComputerName>` tag in the sysprep file will only affect the hostname of the guest OS, not the VM name in the cloud provider.

Option C is incorrect because calling an external Python eScript to register the VM name in DNS will not change the VM name in the cloud provider either. Option D is incorrect because setting the VM Name field to allow user edits at launch will require manual input from the user for each VM, which is not scalable or automated.
