### Salesforce Certified Tableau Architect Sample Questions (Q135-Q140):

NEW QUESTION # 135

When conducting a resource analysis to identify performance bottlenecks in Tableau Server, which metric is most critical to examine?

- A. The CPU and memory utilization of the Tableau Server during peak usage times
- B. The version of the Tableau Server software and its compatibility with the operating system
- C. The total disk space used by Tableau Server data extracts
- D. The number of user licenses utilized on the Tableau Server

**Answer: A**

Explanation:

The CPU and memory utilization of the Tableau Server during peak usage times When performing a resource analysis to identify performance bottlenecks, it is essential to examine the CPU and memory utilization of Tableau Server, especially during peak usage times. High utilization of these resources can indicate that the server is under strain and may be the cause of performance issues. Understanding these metrics helps in pinpointing the need for resource scaling or optimization. Option A is incorrect because while disk space used by data extracts is important, it does not directly indicate CPU and memory bottlenecks. Option C is incorrect as the number of user licenses utilized does not directly affect the server's resource utilization. Option D is incorrect because while software version and compatibility are important, they are not directly related to real-time resource utilization and performance bottlenecks.

#### NEW QUESTION # 136

When installing Tableau Server on a Windows system, which step is essential to ensure a successful installation using the Installation Wizard?

- A. Setting up a dedicated virtual machine for the Tableau Server installation process
- B. Configuring Windows to automatically update all system drivers during the Tableau Server installation
- C. Running the Installation Wizard as an administrator to ensure sufficient privileges for setup
- D. Disabling all antivirus and firewall software on the Windows system during installation

**Answer: C**

Explanation:

Running the Installation Wizard as an administrator to ensure sufficient privileges for setup When installing Tableau Server on Windows, it is crucial to run the Installation Wizard as an administrator. This ensures that the installer has the necessary privileges to access system resources and configure settings required for the successful installation of Tableau Server. Option A is incorrect because while antivirus or firewall software can sometimes interfere with installations, it's not recommended to disable all security software as a first step. Option C is incorrect as automatically updating system drivers during the installation is not a standard requirement for installing Tableau Server. Option D is incorrect because setting up a dedicated virtual machine is not a requirement for installing Tableau Server, though it can be an option based on organizational policies.

#### NEW QUESTION # 137

When configuring an external repository for Tableau Server, which of the following steps is essential for ensuring secure and efficient access to the repository?

- A. Set the repository to allow anonymous access for ease of connectivity
- B. Implement repository partitioning based on user roles and permissions in Tableau
- C. Configure a direct VPN connection between the Tableau Server and the external repository
- D. Use a dedicated service account with restricted permissions for repository access

**Answer: D**

Explanation:

Use a dedicated service account with restricted permissions for repository access Utilizing a dedicated service account with restricted permissions is crucial for maintaining security while accessing an external repository. This ensures that Tableau Server interacts with the repository in a controlled manner, reducing the risk of unauthorized access or data breaches. Option A is incorrect because allowing anonymous access compromises security and is not recommended for external repositories. Option B is incorrect as a direct VPN connection, while secure, is not a necessary step for configuring an external repository in Tableau Server. Option C is incorrect because repository partitioning based on user roles and permissions is not a standard feature or requirement for Tableau Server's external repository configuration.

### NEW QUESTION # 138

When integrating Tableau content into a custom web application using connected apps, what is a key step in configuring this integration securely?

- A. Setting up connected apps in Tableau Server with specific permissions and access controls for the web application
- B. Allowing the connected app to access Tableau Server content without any restrictions for ease of integration
- C. Configuring the web application to bypass Tableau Server's security protocols for a direct connection
- D. Requiring manual authentication for each user session in the web application to access Tableau content

**Answer: A**

Explanation:

Setting up connected apps in Tableau Server with specific permissions and access controls for the web application A key step in securely integrating Tableau content into a custom web application is to set up connected apps in Tableau Server with specific permissions and access controls. This approach ensures that the web application can securely access the necessary Tableau content while maintaining appropriate security and access restrictions. Option A is incorrect because allowing unrestricted access poses a significant security risk. Option C is incorrect as requiring manual authentication for each session can be cumbersome and may not be necessary with the proper configuration of connected apps. Option D is incorrect because bypassing Tableau Server's security protocols would undermine the security and integrity of the data and content.

### NEW QUESTION # 139

When creating a custom administrative view in Tableau to analyze user activity, which table in the Tableau repository should you focus on to understand user login patterns?

- A. The 'historical\_events' table to analyze specific events like user logins and logouts
- B. The 'datasources' table to monitor the data sources each user accesses
- C. The 'workbooks' table to see which workbooks are most frequently used by users
- D. The 'sites' table to determine which sites users are accessing most frequently

**Answer: A**

Explanation:

The 'historical\_events' table to analyze specific events like user logins and log-outs For analyzing user login patterns in Tableau, the 'historical\_events' table in the repository is the most relevant. This table records various events, including user authentication events like logins and logouts, providing valuable insights into user access patterns and activity on the server. Option A is incorrect because the 'datasources' table focuses on data sources and does not provide information about user login patterns. Option B is incorrect as the 'workbooks' table, while useful for understanding workbook usage, does not track user login events. Option D is incorrect because the 'sites' table provides information about sites on the server but does not specifically track user login events.
