AP-202 Test Price & AP-202 Reliable Exam Vce

In this knowledge-dominated world, the combination of the knowledge and the practical working competences has been paid high attention to is extremely important. If you want to improve your practical abilities you can attend the certificate examination. Our AP-202 exam questions are compiled by experts and approved by authorized personnel and boost varied function so that you can learn AP-202 Test Torrent conveniently and efficiently. Our passing rate is 98%-100% and there is little possibility for you to fail in the exam. But if you are unfortunately to fail in the exam we will refund you in full immediately.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q125-Q130):

NEW QUESTION # 125

Which handlebars helper expression is used in Salesforce B2B Commerce pages and components to toggle the display of a block of markup?

- A. `{{#ifConfig 'Field__c'}} ... {{/ifConfig}}`
- B. `{{#ifSetting 'Page.cfg'}} ... {{/ifSetting}}`
- C. `{{#ifDisplay 'Page.cfg'}} ... {{/ifDisplay}}`
- D. `{{#ifStoreSetting 'Field__c'}} ... {{/ifStoreSetting}}`

Answer: A

Explanation:

The handlebars helper expression that is used in Salesforce B2B Commerce pages and components to toggle the display of a block of markup is `{{#ifConfig 'Field__c'}} ... {{/ifConfig}}`. This expression will evaluate the value of the configuration setting with the

API name `Field__c` and render the block of markup if the value is true, or skip it if the value is false. For example, `{{#ifConfig 'CO.showMiniCart'}} <div id='mini-cart'> ... </div> {{/ifConfig}}` will render the mini-cart div only if the configuration setting `CO.showMiniCart` is true. NEW QUESTION # 126

Which code statement should a developer use to import the ID of the current Lightning Experience

- A. `import id from '@salesforce/experience/ld'`
- B. `import id from '@salesforce/network/ld'`
- C. `import id from '@salesforce/community/ld'`
- D. `import id from '@salesforce/site/ld'`

Answer: C

Explanation:

To import the ID of the current Lightning Experience community, a developer should use the following code statement:

```
import id from '@salesforce/community/ld';
```

The `@salesforce/community` module allows the developer to access information about the current community, such as its ID, name, URL, and base path. The other modules do not exist or are not related to the community ID. The `@salesforce/network` module is used to access information about the current network, such as its ID and name. The `@salesforce/experience` module is used to access information about the current user experience, such as whether it is standard or custom. The `@salesforce/site` module is used to access information about the current site, such as its name and prefix. NEW QUESTION # 127

Which two statement are true for Mass Order (2 answers)

- A. Mass Order pricing is done via a batch job.
- B. Mass Order is mobile ready with the ccrz templates.
- C. The variation product is leveraged for SKUs.
- D. Mass order works with the default wishlists

Answer: A,C

Explanation:

Mass Order pricing is done via a batch job, which means that the prices are not calculated in real time, but rather at a scheduled time. Mass order works with the variation product, which is a product that has multiple SKUs with different attributes, such as size or color. Mass order does not work with the default wishlists, which are used to store products that the customer wants to buy later. Mass order is not mobile ready with the ccrz templates, which are the default templates for the storefront pages. Salesforce B2B Commerce Developer Guide: Mass Order, B2B Commerce Developer Guide: Variation Products

NEW QUESTION # 128

Northern Tail Outfitters (NTO) is converting an existing aura component into a Lightning Web Component. The aura component has the following source code:

□ What is the equivalent of this code in a Lightning Web Component?

- A. □
- B. □
- C. □
- D. □

Answer: A

Explanation:

The equivalent of this code in a Lightning web component is option B. Option B uses the `@api` decorator to expose `firstName` as a public property of the Lightning web component and communicate it with other components or services. The `@api` decorator is a decorator that marks a property or method as public, which means that it can be accessed by other components or services that use or consume this component. The `@api` decorator also makes the property reactive, which means that it can track changes and

update the component accordingly. In option B, `firstName` is exposed as a public property using the `@api` decorator and passed to the child element using an attribute. Option A is incorrect because it uses an invalid syntax for exposing `firstName` as a public property. The `@api` decorator should be used before the property declaration, not after it. Option C is incorrect because it uses an invalid syntax for exposing `firstName` as a public property. The `@api` decorator should be used with parentheses, not without them. Option D is incorrect because it uses an invalid syntax for exposing `firstName` as a public property. The `@api` decorator should be used with camel case, not with hyphens. NEW QUESTION # 129

Which two behaviors does a target value of `lightning__FlowScreen` in metadata allow for a Lightning web component?

- A. It allows the Lightning Web component to be dragged onto a page in Lightning App Builder
- B. It allows the Lightning web component to replace standard functionality in flows and subflows
- C. It allows the Lightning web component to be used in guided user experiences to gather input
- D. It automatically generates configuration properties for the Lightning web component

Answer: C,D

Explanation:

A target value of `lightning__FlowScreen` in metadata allows for a Lightning web component to be used in guided user experiences to gather input and to automatically generate configuration properties for the Lightning web component. The `lightning__FlowScreen` target value specifies that the component can be used on a flow screen, which is a type of flow element that displays information and collects user input in a flow. A flow is a guided user experience that can automate business processes and guide users through screens, actions, and decisions. By using the `lightning__FlowScreen` target value, the developer can expose their Lightning web component as a custom screen component that can be added to any flow screen. The developer can also use the `@api` decorator to expose public properties of their Lightning web component as configuration properties that can be set in Flow Builder. Flow Builder is a tool that allows the developer to create and modify flows using a drag-and-drop interface. A target value of `lightning__FlowScreen` does not allow the Lightning web component to replace standard functionality in flows and subflows or to be dragged onto a page in Lightning App Builder, as these are not related to the flow screen target value.
