PECB Certified ISO/IEC 27001 Lead Auditor exam ISO-IEC-27001-Lead-Auditor Prüfungsfragen mit Lösungen (Q333-Q338):

333. Frage
After analyzing the audit conclusions, Company X decided to accept the risk related to one of the detected nonconformities. They claimed that no corrective action was necessary; however, their decision was not documented. Is this acceptable?

- A. No, the decision of the auditee to accept the risk instead of implementing corrective actions should be justified and documented
- B. Yes, the auditee's management can decide to accept the risk instead of implementing corrective actions and documenting such decision is not necessary
- C. No, the auditee must implement corrective actions for all the observations documented during the audit

Antwort: A

Begründung:
According to ISO/IEC 27001 standards, if the auditee decides to accept the risk instead of implementing corrective actions for a nonconformity, this decision should be justified and documented. Documenting such decisions is essential for maintaining the integrity of the ISMS and for demonstrating that the decision was made based on informed judgment.

334. Frage
Which one of the following options is the definition of the context of an organisation?

- A. The control of internal and external issues that can have an effect on an organisation's desire to achieve its objectives
- B. A combination of internal and external issues that can have an effect on an organisation's approach to developing and achieving its objectives
- C. Complexity of internal and external issues that can have an effect on an organisation's approach to developing and achieving its purpose
- D. The coordination of internal and external issues that can have a positive or negative effect on an organisation's success

Antwort: B

Begründung:
Explanation
The context of the organisation is the business environment in which the organisation operates and defines its information security management system (ISMS). It includes the internal and external factors and conditions that can influence the organisation's information security objectives, strategies, and policies. The context of the organisation helps the organisation to identify the scope, boundaries, and requirements of the ISMS, as well as the interested parties and their expectations. The context of the organisation is determined by considering both internal and external issues, such as the organisational structure, culture, values, mission, vision, objectives, strategies, resources, capabilities, processes, activities, products, services, markets, customers, competitors, suppliers, partners, regulators, laws, regulations, standards, guidelines, best practices, risks, opportunities, threats, vulnerabilities, etc.

336. Frage
All are prohibited in acceptable use of information assets, except:

- A. Messages with very large attachments or to a large number ofrecipients.
- B. E-mail copies to non-essential readers

- C. Electronic chain letters
- D. Company-wide e-mails with supervisor/TL permission.

Antwort: D

Begründung:
The only option that is not prohibited in acceptable use of information assets is C: company-wide e-mails with supervisor/TL permission. This option implies that the sender has obtained the necessary authorization from their supervisor or team leader to send an e-mail to all employees in the organization. This could be done for legitimate business purposes, such as announcing important news, events or updates that are relevant to everyone. However, this option should still be used sparingly and responsibly, as it could cause unnecessary disruption or annoyance to the recipients if abused or misused. The other options are prohibited in acceptable use of information assets, as they could violate the information security policies and procedures of the organization, as well as waste resources and bandwidth. Electronic chain letters (A) are messages that urge recipients to forward them to multiple other people, often with false or misleading claims or promises. They are considered spam and could contain malicious links or attachments that could compromise information security. E-mail copies to non-essential readers (B) are messages that are sent to recipients who do not need to receive them or have no interest in them. They are considered unnecessary and could clutter the inbox and distract the recipients from more important messages. Messages with very large attachments or to a large number of recipients (D) are messages that consume a lot of network resources and could affect the performance or availability of the information systems. They could also exceed the storage capacity or quota limits of the recipients' mailboxes and cause problems for them. ISO/IEC 27001:2022 requires the organization to implement rules for acceptable use of assets (see clause A.8.1.3). - Security techniques - Information security management systems - Requirements, What is Acceptable Use?

337. Frage
You are an experienced ISMS audit team leader. During the conducting of a third-party surveillance audit, you decide to test your auditee's knowledge of ISO/IEC 27001's risk management requirements.
You ask her a series of questions to which the answer is either 'that is true' or 'that is false'. Which four of the following should she answer 'that is true'?

- A. Risk identification is used to determine the severity of an information security risk
- B. Risk assessments should be undertaken following significant changes
- C. The results of risk assessments must be maintained
- D. ISO/IEC 27001 provides an outline approach for the management of risk
- E. Risks assessments should be undertaken at monthly intervals
- F. The organisation must produce a risk treatment plan for every business risk identified
- G. The organisation must operate a risk treatment process to eliminate it's information security risks
- H. The initial phase in an organisation's risk management process should be information security risk assessment

Antwort: B,C,D,F

Begründung:
The following four statements are true according to ISO/IEC 27001's risk management requirements: 12 The results of risk assessments must be maintained. This is true because clause 8.2.3 of ISO/IEC 27001:2022 requires the organisation to retain documented information of the information security risk assessment process and the results12 ISO/IEC 27001 provides an outline approach for the management of risk. This is true because clause 6.1.2 of ISO/IEC 27001:2022 specifies the general steps for the information security risk management process, which include establishing the risk criteria, assessing the risks, treating the risks, and monitoring and reviewing the risks12 The organisation must produce a risk treatment plan for every business risk identified. This is true because clause 6.1.3 of ISO/IEC 27001:2022 requires the organisation to produce a risk treatment plan that defines the actions to be taken to address the unacceptable risks, the responsibilities, the expected dates, and the resources required12 Risk assessments should be undertaken following significant changes. This is true because clause 8.2.4 of ISO/IEC 27001:2022 requires the organisation to review and update the risk assessment at planned intervals or when significant changes occur12 The following four statements are false according to ISO/IEC 27001's risk management requirements:
Risk identification is used to determine the severity of an information security risk. This is false because risk identification is used to identify the assets, threats, vulnerabilities, and existing controls that are relevant to the information security risk management process. The severity of an information security risk is determined by the risk analysis, which evaluates the likelihood and impact of the risk scenarios12 The organisation must operate a risk treatment process to eliminate its information security risks. This is false because the organisation can choose from four options to treat its information security risks: avoid, transfer, mitigate, or accept. The organisation does not have to eliminate all its information security risks, but only those that are unacceptable according to its risk criteria12 The initial phase in an organisation's risk management process should be information security risk assessment. This is false because the initial phase in an organisation's risk management process should be establishing the risk management framework, which

includes defining the risk management policy, objectives, scope, roles, responsibilities, and criteria. The information security risk assessment is the second phase in the risk management process12 Risks assessments should be undertaken at monthly intervals. This is false because there is no fixed frequency for conducting risk assessments in ISO/IEC 27001. The organisation should determine the appropriate intervals for reviewing and updating the risk assessment based on its risk appetite, risk profile, and operational context12 Reference:
