

Free PDF Accurate NREMT - EMT - Emergency Medical Technicians Exam Test Collection Pdf

DOWNLOAD the newest Free4Torrent EMT PDF dumps from Cloud Storage for free: <https://drive.google.com/open?id=1c7qGC4bqwhlt4gqxhoyr8McPi9S6bnAE>

Free4Torrent is an authoritative study platform to provide our customers with different kinds of EMT practice torrent to learn, and help them accumulate knowledge and enhance their ability to pass the exam as well as get their expected scores. There are three different versions of our EMT Study Guide: the PDF, the Software and the APP online. To establish our customers' confidence and avoid their loss for choosing the wrong exam material, we offer related free demos of EMT exam questions for our customers to download before purchase.

There are advantages of Getting the Test Prep EMT Exam Certification

- Benefits generally include medical, dental, and vision insurance, as well as vacation, sick leave, and retirement plans.
- Emergency medical technicians who work for the fire department or the police generally enjoy the same benefits as the fire department or the police.

Test Prep EMT Exam Introduction

The National Register Emergency Medical Technician (EMT) cognitive test is a computer adaptive test (CAT). This means that each candidate is evaluated based on the position of the responses on a spectrum. Once a candidate gets the correct answers, the computer will automatically enter more difficult questions to continue testing the candidate's skill level. The number of items a candidate can expect from the EMT Exam will be between 70 and 120. Each exam will have between 60 and 110 "live" elements that will be counted towards the final score. The exam will also include 10 pilot questions that do not affect the final score. The maximum time allowed to complete the exam is 2 hours. To pass the exam, candidates must meet a standard skill level. The standard of success is defined by the ability to provide safe and effective entry-level emergency medical care.

Exam EMT Practice | EMT Dump Collection

As the saying goes, to develop study interest requires to giving learner a good key for study, this is promoting learner active development of internal factors. The most function of our EMT question torrent is to help our customers develop a good study habits, cultivate interest in learning and make them pass their exam easily and get their EMT Certification. All workers of our company are working together, in order to produce a high-quality product for candidates.

NREMT Emergency Medical Technicians Exam Sample Questions (Q36-

Q41):

NEW QUESTION # 36

While assisting an ALS unit, you observe a contaminated needle has been stuck into the mattress. You should

- A. carefully withdraw the needle and place it in the sharps container.
- B. remove the needle, re-cap it, and dispose of it in an approved container.
- C. confront the paramedic in front of the patient.
- D. do or say nothing regarding the needle.

Answer: A

Explanation:

NREMT standards emphasize scene safety, infection control, and proper sharps handling to reduce the risk of occupational exposure. A contaminated needle left in a mattress presents a serious needlestick hazard to EMS providers, hospital staff, and patients.

Option B is correct because the appropriate action is to carefully remove the needle and immediately dispose of it in an approved sharps container. This follows OSHA and NREMT infection-control principles, which state that sharps must be disposed of promptly in puncture-resistant containers without unnecessary handling.

Option A is incorrect because recapping needles is strictly prohibited under standard precautions.

Recapping significantly increases the risk of accidental needlestick injuries and violates established safety guidelines.

Option C is incorrect because confronting a paramedic in front of a patient is unprofessional and undermines team dynamics. Any concerns regarding unsafe practices should be addressed privately and through appropriate supervisory channels.

Option D is incorrect because ignoring an exposed sharp creates an ongoing safety hazard and fails the EMT's responsibility to maintain a safe environment.

In summary, NREMT expects EMTs to act proactively to reduce hazards, follow standard precautions, and safely dispose of sharps without recapping or delay. Removing the needle carefully and placing it in a sharps container is the safest and most appropriate response.

NEW QUESTION # 37

A 24-year-old patient is in respiratory distress after being stung by a bee. What initial management action should the EMT take for this patient?

- A. Give a bronchodilator
- B. Administer epinephrine auto-injector
- C. Perform a primary survey
- D. Immediately transport the patient

Answer: C

Explanation:

The correct answer is B. Perform a primary survey.

This question is testing initial EMS priorities, not just treatment selection.

According to NREMT standards, every patient encounter begins with a primary assessment (primary survey), which includes:

- * Airway
- * Breathing
- * Circulation
- * Identifying life threats

Why B is correct (Primary survey):

Even though the patient is likely experiencing anaphylaxis, EMTs must:

- * Rapidly assess airway, breathing, and circulation
- * Identify severity of respiratory distress
- * Then immediately intervene (e.g., epinephrine)

NREMT guidance states:

- * "The primary assessment is the first step in patient care."
- * "Life-threatening conditions are identified and managed during the primary survey." Why D is not the best initial answer:
- * Epinephrine is the correct treatment, but it is administered after performing the primary survey.
- * The question asks for the initial management action, which is always the primary assessment.

Why the other options are incorrect:

- * A. Bronchodilator: Not first-line for anaphylaxis.

* C. Immediate transport: Important, but only after initial assessment and stabilization.

Exact Extracts:

* "The primary assessment identifies immediate life threats."

* "Airway, breathing, and circulation must be assessed first in all patients."

* "Treatment interventions follow the primary survey."

NEW QUESTION # 38

A 48-year-old patient was shot in their left shoulder. The EMT observes bright red blood pulsating from the wound. Which of the following actions should the EMT perform first?

- A. Place a tourniquet.
- B. Place a sling and swathe.
- C. Apply oxygen by non-rebreather mask.
- **D. Apply direct pressure.**

Answer: D

Explanation:

The correct answer is B. Apply direct pressure.

This patient is experiencing severe arterial bleeding, as indicated by:

Bright red blood

Pulsating flow

Direct pressure is the first-line treatment for external bleeding, including arterial hemorrhage.

It is the fastest and most effective immediate intervention to control bleeding.

EMT protocols emphasize controlling life-threatening bleeding before other interventions.

A). Place a tourniquet # Appropriate if direct pressure fails or bleeding is uncontrollable, but not the first step C). Sling and swathe #

Used for immobilization, not hemorrhage control D). Oxygen # Important, but bleeding control takes priority (circulation first in trauma) Exact Extracts:

"Control external bleeding with direct pressure as the first step."

"Arterial bleeding is characterized by bright red, pulsating blood."

"Tourniquets are used when direct pressure fails to control severe bleeding." References:

NEW QUESTION # 39

Which of the following is an acute sign of closed head trauma?

- **A. Memory loss**
- B. Battle ' s sign
- C. Beck ' s Triad
- D. Raccoon eyes

Answer: A

Explanation:

The correct answer is A. Memory loss.

Why A is correct (Memory loss):

Memory loss (amnesia) is a common and immediate (acute) sign of closed head injury, especially in concussions. It may include:

* Retrograde amnesia (loss of memory before the event)

* Anterograde amnesia (inability to form new memories)

NREMT-aligned trauma guidance states:

* "Patients with head injuries may present with confusion or memory loss immediately after the event."

* This is considered an early indicator of brain injury.

Why the other options are incorrect:

- * B. Beck ' s Triad: Associated with cardiac tamponade (hypotension, JVD, muffled heart sounds), not head trauma.
- * C. Battle ' s sign: Bruising behind the ears indicating a basilar skull fracture, but this is typically a late sign, not acute.
- * D. Raccoon eyes: Periorbital ecchymosis also indicating a basilar skull fracture, and similarly a delayed finding, not immediate.

Key Concept:

- * Acute signs = occur immediately (e.g., confusion, memory loss, LOC)
- * Late signs = develop over time (e.g., Battle's sign, raccoon eyes)

Exact Extracts:

- * "Early signs of head injury include confusion, disorientation, and memory loss."
- * "Battle's sign and raccoon eyes are late signs of basilar skull fracture."
- * "Assessment should identify immediate neurologic changes following trauma." References:

NEW QUESTION # 40

An EMT has just assisted with the delivery of a newborn. At the five-minute mark, the neonate is completely pink with a pulse of 108/min. The neonate has some flexion of their extremities, but the breathing is still slow.

How should the EMT score the following categories of the APGAR scale? Select the correct value for each sign.

	1 point	2 points
Appearance	<input type="radio"/>	<input type="radio"/>
Pulse	<input type="radio"/>	<input type="radio"/>
Activity	<input type="radio"/>	<input type="radio"/>
Respirations	<input type="radio"/>	<input type="radio"/>

Answer:

Explanation:

Answer Area	1 point	2 points
Appearance	<input type="radio"/>	<input checked="" type="radio"/>
Pulse	<input type="radio"/>	<input checked="" type="radio"/>
Activity	<input checked="" type="radio"/>	<input type="radio"/>
Respirations	<input checked="" type="radio"/>	<input type="radio"/>

Explanation:

Answer Area	1 point	2 points
Appearance	<input type="radio"/>	<input checked="" type="radio"/>
Pulse	<input checked="" type="radio"/>	<input type="radio"/>
Activity	<input checked="" type="radio"/>	<input type="radio"/>
Respirations	<input checked="" type="radio"/>	<input type="radio"/>

Appearance (Skin Color): # 2 points

The neonate is completely pink.

APGAR criteria:

0 = blue/pale

1 = pink body, blue extremities

2 = completely pink

Pulse (Heart Rate): # 2 points

Heart rate is 108/min.

APGAR criteria:

0 = absent

1 = < 100/min

2 = # 100/min

Activity (Muscle Tone): # 1 point

The neonate has some flexion of extremities, but not active motion.

APGAR criteria:

0 = limp

1 = some flexion

2 = active motion

Respirations: # 1 point

Breathing is slow, not strong crying.

APGAR criteria:

0 = absent

1 = slow or irregular respirations

2 = strong cry

Total APGAR Score at 5 Minutes: 6 / 10

Interpretation (NREMT-based):

A score of 6 indicates the newborn requires continued supportive care, such as warming, positioning, stimulation, and close monitoring.

No immediate chest compressions are indicated because the heart rate is > 100/min.

Respiratory effort should continue to be assessed closely.

This scoring aligns with NREMT neonatal assessment and APGAR scoring guidelines used for evaluating newborn transition after birth.

NEW QUESTION # 41

.....

With the rapid development of computer, network, and semiconductor techniques, the market for people is becoming more and more hotly contested. Passing a EMT exam to get a certificate will help you to look for a better job and get a higher salary. If you are tired of finding a high quality study material, we suggest that you should try our EMT Exam Prep. Because our materials not only has better quality than any other same learn products, but also can guarantee that you can pass the EMT exam with ease.
