- A. Protecting the crime scene
- B. Preserving temporary and fragile evidence and then shut down or reboot the victim's computer
- C. Identifying the crime scene
- D. Packaging and transporting the electronic evidence

Answer: A

NEW QUESTION # 57

Clark is investigating a cybercrime at TechSoft Solutions. While investigating the case, he needs to collect volatile information such as running services, their process IDs, startmode, state, and status.

Which of the following commands will help Clark to collect such information from running services?

- A. net file
- B. wmic
- C. netstat -ab
- D. Openfiles

Answer: D

Explanation:

WMIC (Windows Management Instrumentation Command-line) is a command-line tool that provides a unified interface for Windows management tasks, including the collection of system information. It allows administrators and forensic investigators to query the live system for information about running services, their process IDs, start modes, states, and statuses, among other data. The use of WMIC is particularly valuable in incident response scenarios for gathering volatile information from a system without having to install additional software, which might alter the state of the system being investigated. By executing specific WMIC commands, Clark can extract detailed information about the services running on a system at the time of the investigation, making it an essential tool for collecting volatile data in a forensically sound manner.

References: The ECIH v3 courses and study guides emphasize the importance of collecting volatile data during incident response and digital forensics investigations. They specifically highlight the use of built-in Windows tools like WMIC for gathering essential system information without compromising the integrity of the evidence.
