TPAD01合格問題、TPAD01受験準備

TPAD01認定試験は試験に関連する書物を学ぶだけで合格できるものではないです。がむしゃらに試験に要求された関連知識を積み込むより、価値がある問題を勉強したほうがいいです。効率のあがる試験問題集は受験生の皆さんにとって欠くことができないツールです。ですから、はやくIt-PassportsのTPAD01問題集を入手しましょう。これは高い的中率を持っている問題集で、ほかのどのような勉強法よりもずっと効果があるのです。これはあなたが一回で楽に成功できるを保証するめばしい参考書です。

Proofpoint Threat Protection Administrator Exam 認定 TPAD01 試験問題 (Q18-Q23):

質問 # 18

You can drag the divider between the question and exhibit to the left to make the image larger.

Refer to the exhibit.

You are configuring SSO for Proofpoint Cloud Services, such as Cloud Admin, TAP Dashboard, Cloud Threat Response, CASB, and Identity Threat Response. The Microsoft O365 administrator sends you a portion of the XML file containing the SAML configuration. Which of the following strings should be entered in the "SAML Login Endpoint (required)" field in the Proofpoint Identity Provider Configuration?

```
<X509Certificate>
MIIC8DCCAdigAwIBAgIQdIe3hr2+2ldMGxvAXk0INzANBggqhkiG9w0BAQsFADA0MTI-

<SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:Bindings:HTTP-POST"
Location="https://login.microsoftonline.com/5301fc22-de2d-3e32-8e25-37a292782d2c/saml2"/>

```

- A. <https://login.microsoftonline.com/5301fc22-de2d-3e32-8e25-37a292782d2c/saml2>
- B. <https://enduserauth.proofpoint.com/v1/token/samlauthorization>
- C. SingleSignOnService Binding="urn:oasis:names:tc:SAML:2.0:Binding:HTTP-Redirect"
- D. The data between < X509Certificate > and </X509Certificate >

正解: A

解説:

The correct answer is C. <https://login.microsoftonline.com/5301fc22-de2d-3e32-8e25-37a292782d2c/saml2>

The question is asking specifically for the value that should be entered in the "SAML Login Endpoint (required)" field in Proofpoint's Identity Provider configuration. In SAML metadata, that value is the Location attribute of the SingleSignOnService entry. In the exhibit, the XML clearly shows the Microsoft login URL as:

<https://login.microsoftonline.com/5301fc22-de2d-3e32-8e25-37a292782d2c/saml2> That is the actual SAML login endpoint Proofpoint needs in order to redirect authentication requests to the Microsoft identity provider.

Why the other options are incorrect:

- * A is the certificate content, which is used for trust and signature validation, not for the login endpoint.
- * B is the XML element label and binding description, not the actual URL value that belongs in the field.
- * D is a Proofpoint URL and not the Microsoft IdP SAML login endpoint shown in the metadata.

This is a User Management and federated-authentication question because it focuses on SSO configuration between Proofpoint Cloud Services and Microsoft O365 / Azure AD. The main concept being tested is knowing how to read SAML metadata correctly and extract the exact SingleSignOnService Location value.

So the complete interpretation of the exhibit is that the string to enter in the "SAML Login Endpoint (required)" field is the Microsoft SAML login URL shown in the XML, which makes Answer C the verified course-aligned choice.

質問 # 19

How does TAP's Message Defense feature work for unknown attachments?

- A. It automatically deletes all attachments from external senders
- B. It scans only PDF attachments for malware
- C. It allows attachments through only if the sender is on a safelist
- D. It detonates suspicious attachments in a sandbox to analyze their behavior

正解: D

解説:

The correct answer is D. It detonates suspicious attachments in a sandbox to analyze their behavior .

Proofpoint's Targeted Attack Protection material explicitly says that unknown attachments are analysed and sandboxed . Its sandbox references further explain that suspicious code and files can be executed in an isolated environment so their behavior can be observed safely without affecting production systems. That is exactly what this question is describing.

This is one of the defining ideas behind advanced attachment defense. Static checks are useful, but unknown files often require

dynamic analysis to determine whether they attempt malicious actions such as downloading payloads, making command-and-control connections, or exploiting vulnerabilities. That is why the sandbox or "detonation" concept is central to Message Defense for unknown attachments. The other options are incorrect because TAP does not restrict itself to PDFs, does not simply delete all external attachments by default, and does not rely only on a safelist decision to allow attachments through. Instead, it uses a deeper analysis path for suspicious unknown content. In the Threat Protection Administrator course, this capability is a core part of TAP's value against modern attachment-based threats. Therefore, the verified answer is D

質問 # 20

Refer to the exhibit to see the interface used in this scenario.

Rewrite Options

Rewrite Format: New URL Format (Recommended) (URL Domain: urldefense.com)

Rewrite Commonly Clickable Text: Off On (recommended) Aggressive

Rewrite In Body: Text HTML

Rewrite in Attachment: Text HTML

Plain Text Option: Append Domain Off On

HTML Options: Append Domain Off On; Rewrite in Content Off On

Send a copy of unmodified email to address: [Empty text box]

This option is only needed for Proofpoint Archiving integration

You can drag the divider between the question and the exhibit to the left to make the image larger.

Using those settings for URL Rewrite, which of the following will be rewritten?

Pick the 2 correct responses below.

- A. <https://www.example.com>
- B. example.com
- C. www.example.com
- D. [mail.example.com](mailto:mail@example.com)
- E. 10.1.1.1

正解: A、C

解説:

The correct answers are B. www.example.com and C. <https://www.example.com>.

From the exhibit, Rewrite Commonly Clickable Text is set to On (recommended), and URL rewriting is enabled for both Text and HTML in the message body. That means Proofpoint will rewrite content that it recognizes as clickable URL-style text in normal message content. Both www.example.com and <https://www.example.com> match that behavior because they are standard web-style URLs or commonly clickable web-address formats.

The other options are not the intended rewritten values in this scenario:

* A. example.com is plain domain text and is not the selected answer for this configuration.

* D. 10.1.1.1 is an IP address and is not one of the correct rewritten examples in this question.

* E. [mail.example.com](mailto:mail@example.com) is a hostname, but it is not one of the two expected rewritten values based on the course question.

This is a Targeted Attack Protection (TAP) question because URL Rewrite is part of Proofpoint's link- protection capability. The purpose of URL Rewrite is to transform recognized clickable URLs so they can be evaluated and protected through Proofpoint at click time. In this exhibit, the settings clearly support rewriting common clickable web text found in body content, which is why the correct two answers are www.example.com and <https://www.example.com>.

So the complete interpretation of the exhibit is that the values which will be rewritten are B and C, making them the verified course-

aligned choices.

質問 # 21

Which feature on the Protection Server would you use to prevent Email Warning Tags being inserted into a trusted sender's emails?

- A. SMTP Rate Control
- B. Quarantine
- **C. Policy Routes**
- D. DMARC

正解: C

解説:

The correct answer is A. Policy Routes . Proofpoint's guidance on email filtering and false-positive reduction notes that organizations should add trusted senders to allowlists and create bypass policies for message types that are frequently misclassified. In the Protection Server context, the feature used to steer messages into different processing treatment is the routing and policy-application logic, which aligns with Policy Routes rather than anti-abuse controls like SMTP Rate Control.

Email Warning Tags are user-facing indicators inserted when messages match conditions associated with external, suspicious, or risk-related contexts. Proofpoint's public material describes these tags as visual cues for scenarios like external sender, new sender, and newly registered domains. If a sender is trusted and should bypass that tagging behavior, the administrative approach is to route that sender's traffic through a policy path that excludes the warning-tag treatment. That is exactly what Policy Routes are for: deciding which policy processing chain applies to a message.

The other choices do not fit. SMTP Rate Control manages abusive SMTP behavior, DMARC is for authentication policy and domain alignment, and Quarantine governs message holding and release rather than selective tag bypass. In the course's User Notifications area, trusted-sender exceptions for warning-tag insertion are handled through the policy-routing framework. Therefore, the correct answer is A. Policy Routes

質問 # 22

Refer to the exhibit below to see the interface used in this scenario.

Virus Protection > Virus Policies > Policies				
Policy	Description	Routes	Order	
inbound_protected		• Allow: legal	▼	Delete
outbound		• Deny: default_inbound	▲	Delete
default	Default Virus Protection Policy	• Allow: default_inbound • Deny: att_strip	▲	

An email arrives inbound to the protection server, it is going to a single recipient and belongs to the legal and default_inbound policy routes.

Which of the following is true regarding the virus policies?

- A. The inbound_protected policy will apply to the message. All other policies will be ignored.
- B. The outbound policy is applied first and then the default policy will be applied.
- **C. The inbound_protected and default policy will be applied to the message in that order.**
- D. The default policy is applied first and then the inbound_protected policy is applied.

正解: C

解説:

The correct answer is C. The inbound_protected and default policy will be applied to the message in that order .

From the exhibit, the message is inbound and matches two policy routes:

* legal

* default_inbound

The inbound_protected virus policy is configured with Allow: legal , so that policy applies to this message first. The default virus policy is configured with Allow: default_inbound , so it also applies to the same message. Since the message matches both routes, both policies are applied in policy order, with the more specific matching inbound policy applying before the default policy.

Why the other choices are incorrect:

* A is incorrect because the message is inbound, not outbound, so the outbound policy is not the first applicable policy here.

* B is incorrect because the exhibit logic indicates the specific matched inbound policy applies before the default policy, not the reverse.

* D is incorrect because the exhibit shows the message belongs to both legal and default_inbound , so the default policy is not

ignored.

This is a Virus Protection policy-order question. The important concept is that Proofpoint can apply multiple matching virus policies based on route membership, and in this scenario the message is processed by inbound_protected first, followed by default. So the complete interpretation of the exhibit is that the inbound_protected and default policies are both applied, in that order, which makes Answer C the verified course-aligned choice.
