

Professional-Cloud-DevOps-Engineer Valid Test Practice - Professional-Cloud-DevOps-Engineer Reliable Source

What's more, part of that DumpsValid Professional-Cloud-DevOps-Engineer dumps now are free: <https://drive.google.com/open?id=1hvF3s75etTh50r8gfHZKGr2Dzs6jYkp94>

Sometimes hesitating will lead to missing a lot of opportunities. If you think a lot of our Professional-Cloud-DevOps-Engineer exam dumps PDF, you should not hesitate again. Too much hesitating will just waste a lot of time. Our Professional-Cloud-DevOps-Engineer exam dumps PDF can help you prepare casually and pass exam easily. If you make the best use of your time and obtain a useful certification you may get a senior position ahead of others. Chance favors the prepared mind. DumpsValid provide the best Professional-Cloud-DevOps-Engineer Exam Dumps Pdf materials in this field which is helpful for you.

The Google Cloud Certified - Professional Cloud DevOps Engineer Exam certification exam is a performance-based exam that consists of tasks that the candidate needs to complete within a set time frame. Professional-Cloud-DevOps-Engineer exam is designed to test the candidate's ability to apply their knowledge of GCP and DevOps principles to real-world scenarios. Professional-Cloud-DevOps-Engineer exam covers a wide range of topics, including building and deploying applications on GCP, designing and implementing continuous delivery pipelines, configuring monitoring and logging systems, and managing GCP resources using automation tools.

Google Professional-Cloud-DevOps-Engineer (Google Cloud Certified - Professional Cloud DevOps Engineer) certification exam is designed for individuals who are interested in demonstrating their proficiency in the DevOps practices and principles of Google Cloud. Google Cloud Certified - Professional Cloud DevOps Engineer Exam certification is intended for professionals who have a deep understanding of the core concepts of DevOps and possess hands-on experience in implementing these principles using Google

Cloud technologies. Professional-Cloud-DevOps-Engineer Exam Tests candidates on their ability to design, implement, and manage continuous delivery systems and pipelines, as well as their ability to implement deployment management strategies.

Perfect Professional-Cloud-DevOps-Engineer Valid Test Practice Covers the Entire Syllabus of Professional-Cloud-DevOps-Engineer

Since the content of the examination is also updating daily, you will need real and latest Google Professional-Cloud-DevOps-Engineer Exam Dumps to prepare successfully for the Professional-Cloud-DevOps-Engineer certification exam in a short time. People who don't study from updated Google Cloud Certified - Professional Cloud DevOps Engineer Exam (Professional-Cloud-DevOps-Engineer) questions fail the examination and loss time and money.

Google Cloud Certified - Professional Cloud DevOps Engineer Exam Sample Questions (Q23-Q28):

NEW QUESTION # 23

You are creating a CI/CD pipeline in Cloud Build to build an application container image. The application code is stored in GitHub. Your company requires that production image builds are only run against the main branch and that the change control team approves all pushes to the main branch. You want the image build to be as automated as possible. What should you do?

Choose 2 answers.

- **A. Create a trigger on the Cloud Build job. Set the repository event setting to Push to a branch.**
- B. Add the owners file to the Included files filter on the trigger.
- **C. Configure a branch protection rule for the main branch on the repository.**
- D. Create a trigger on the Cloud Build job. Set the repository event setting to Pull request.
- E. Enable the Approval option on the trigger.

Answer: A,C

Explanation:

The best options for creating a CI/CD pipeline in Cloud Build to build an application container image and ensuring that production image builds are only run against the main branch and that the change control team approves all pushes to the main branch are to create a trigger on the Cloud Build job, set the repository event setting to Push to a branch, and configure a branch protection rule for the main branch on the repository. A trigger is a resource that starts a build when an event occurs, such as a code change. By creating a trigger on the Cloud Build job and setting the repository event setting to Push to a branch, you can ensure that the image build is only run when code is pushed to a specific branch, such as the main branch. A branch protection rule is a rule that enforces certain policies on a branch, such as requiring reviews, status checks, or approvals before merging code. By configuring a branch protection rule for the main branch on the repository, you can ensure that the change control team approves all pushes to the main branch.

NEW QUESTION # 24

You have a CI/CD pipeline that uses Cloud Build to build new Docker images and push them to Docker Hub. You use Git for code versioning. After making a change in the Cloud Build YAML configuration, you notice that no new artifacts are being built by the pipeline. You need to resolve the issue following Site Reliability Engineering practices. What should you do?

- A. Upload the configuration YAML file to Cloud Storage and use Error Reporting to identify and fix the issue.
- **B. Run a Git compare between the previous and current Cloud Build Configuration files to find and fix the bug.**
- C. Disable the CI pipeline and revert to manually building and pushing the artifacts.
- D. Change the CI pipeline to push the artifacts to Container Registry instead of Docker Hub.

Answer: B

Explanation:

"After making a change in the Cloud Build YAML configuration, you notice that no new artifacts are being built by the pipeline"- means something wrong on the recent change not with the image registry.

NEW QUESTION # 25

Your team is building a service that performs compute-heavy processing on batches of data. The data is processed faster based on the speed and number of CPUs on the machine. These batches of data vary in size and may arrive at any time from multiple third-party sources. You need to ensure that third parties are able to upload their data securely. You want to minimize costs while ensuring that the data is processed as quickly as possible. What should you do?

- A. * Provide a Cloud Storage bucket so that third parties can upload batches of data, and provide appropriate identity and Access Management (IAM) access to the bucket
* Create a Cloud Function with a google.storage.object.finalize Cloud Storage trigger. Write code so that the function can scale up a Compute Engine autoscaling managed instance group
* Use an image pre-loaded with the data processing software that terminates the instances when processing completes
- B. * Provide a Cloud Storage bucket so that third parties can upload batches of data, and provide appropriate Identity and Access Management (IAM) access to the bucket
* Use a standard Google Kubernetes Engine (GKE) cluster and maintain two services: one that processes the batches of data and one that monitors Cloud Storage for new batches of data
* Stop the processing service when there are no batches of data to process
- C. * Provide a Cloud Storage bucket so that third parties can upload batches of data, and provide appropriate Identity and Access Management (IAM) access to the bucket
* Use Cloud Monitoring to detect new batches of data in the bucket and trigger a Cloud Function that processes the data
* Set a Cloud Function to use the largest CPU possible to minimize the runtime of the processing
- D. * Provide a secure file transfer protocol (SFTP) server on a Compute Engine instance so that third parties can upload batches of data and provide appropriate credentials to the server
* Create a Cloud Function with a google.storage.object.finalize Cloud Storage trigger. Write code so that the function can scale up a Compute Engine autoscaling managed instance group
* Use an image pre-loaded with the data processing software that terminates the instances when processing completes

Answer: A

Explanation:

The best option for ensuring that third parties are able to upload their data securely and minimizing costs while ensuring that the data is processed as quickly as possible is to provide a Cloud Storage bucket so that third parties can upload batches of data, and provide appropriate Identity and Access Management (IAM) access to the bucket; create a Cloud Function with a google.storage.object.finalize Cloud Storage trigger; write code so that the function can scale up a Compute Engine autoscaling managed instance group; use an image pre-loaded with the data processing software that terminates the instances when processing completes.

A Cloud Storage bucket is a resource that allows you to store and access data in Google Cloud. You can provide a Cloud Storage bucket so that third parties can upload batches of data securely and conveniently.

You can also provide appropriate IAM access to the bucket by using roles and policies to control who can read or write data to the bucket. A Cloud Function is a serverless function that executes code in response to an event, such as a change in a Cloud Storage bucket. A google.storage.object.finalize trigger is a type of trigger that fires when a new object is created or an existing object is overwritten in a Cloud Storage bucket. You can create a Cloud Function with a google.storage.object.finalize trigger so that the function runs whenever a new batch of data is uploaded to the bucket. You can write code so that the function can scale up a Compute Engine autoscaling managed instance group, which is a group of VM instances that automatically adjusts its size based on load or custom metrics. You can use an image pre-loaded with the data processing software that terminates the instances when processing completes, which means that the instances only run when there is data to process and stop when they are done. This way, you can minimize costs while ensuring that the data is processed as quickly as possible.

NEW QUESTION # 26

You support an application running on GCP and want to configure SMS notifications to your team for the most critical alerts in Stackdriver Monitoring. You have already identified the alerting policies you want to configure this for. What should you do?

- A. Select the Webhook notifications option for each alerting policy, and configure it to use a third-party integration tool. Ensure that your team members add their SMS/phone numbers to the external tool.
- B. Download and configure a third-party integration between Stackdriver Monitoring and an SMS gateway. Ensure that your team members add their SMS/phone numbers to the external tool.
- C. Configure a Slack notification for each alerting policy. Set up a Slack-to-SMS integration to send SMS messages when Slack messages are received. Ensure that your team members add their SMS/phone numbers to the external integration.
- D. Ensure that your team members set their SMS/phone numbers in their Stackdriver Profile. Select the SMS notification option for each alerting policy and then select the appropriate SMS/phone numbers from the list.

Answer: C

NEW QUESTION # 27

You are on-call for an infrastructure service that has a large number of dependent systems. You receive an alert indicating that the service is failing to serve most of its requests and all of its dependent systems with hundreds of thousands of users are affected. As part of your Site Reliability Engineering (SRE) incident management protocol, you declare yourself Incident Commander (IC) and pull in two experienced people from your team as Operations Lead (OL) and Communications Lead (CL). What should you do next?

- **A. Look for ways to mitigate user impact and deploy the mitigations to production.**
- B. Establish a communication channel where incident responders and leads can communicate with each other.
- C. Contact the affected service owners and update them on the status of the incident.
- D. Start a postmortem, add incident information, circulate the draft internally, and ask internal stakeholders for input.

Answer: A

NEW QUESTION # 28

.....

Our company has collected the frequent-tested knowledge into our practice materials for your reference according to our experts' years of diligent work. So our Professional-Cloud-DevOps-Engineer exam materials are triumph of their endeavor. By resorting to our Professional-Cloud-DevOps-Engineer Practice Guide, we can absolutely reap more than you have imagined before. We have clear data collected from customers who chose our Professional-Cloud-DevOps-Engineer training engine, the passing rate is 98-100 percent.
