Salesforce Certified Integration Architect Sample Questions (Q88-Q93):

NEW QUESTION # 88

Northern Trail Outfitters has recently experienced intermittent network outages in its call center. When network service resumes, Sales representatives have inadvertently created duplicate orders in the manufacturing system because the order was placed but the return acknowledgement was lost during the outage.

Which solution should an architect recommend to avoid duplicate order booking?

- A. Use Outbound Messaging to ensure manufacturing acknowledges receipt of order.
- B. Implement idempotent design and have Sales Representatives retry order(s) in question.
- C. Have scheduled Apex resubmit orders that do not have a successful response.
- D. Use scheduled apex to query manufacturing system for potential duplicate or missing orders.

Answer: A

NEW QUESTION # 89

The sales Operations team at Northern Trail Outfitters imports new leads each day. An integrated legacy territory management system assigns territories to leads before Sales team members can work on them. The current integration often experiences latency issues.

Which two recommendations should an Architect make to improve the integration performance?

Choose 2 answers

- A. Reduce batch size of asynchronous BULK API.
- B. Legacy system should submit in serial mode.
- C. Legacy system should submit in parallel mode.
- D. Reduce batch size of synchronous BULK API.

Answer: A,C

Explanation:

Explanation

Reducing the batch size of asynchronous BULK API and submitting the legacy system in parallel mode are two recommendations that can improve the integration performance. The BULK API is designed to handle large-scale data loads, but it can also cause latency issues if the batch size is too large or the network bandwidth is insufficient. Reducing the batch size can help to avoid timeouts and improve throughput.

Submitting the legacy system in parallel mode can also speed up the integration process by allowing multiple batches to be processed concurrently, as long as there are no dependencies or conflicts between them.

NEW QUESTION # 90

Which two system constraint questions should be considered when designing an integration to send orders from Salesforce to a fulfillment system?

Choose 2 answers

- A. Which system will validate order shipping addresses?
- **B. Can the fulfillment system participate in idempotent design to avoid duplicate orders?**
- C. Can the fulfillment system implement a contract-first Outbound Messaging interface?
- **D. What latency is acceptable for orders to reach the fulfillment system?**

Answer: B,D

Explanation:

Explanation

The system constraint questions that should be considered when designing an integration to send orders from Salesforce to a fulfillment system are related to the performance, reliability, and scalability of the integration.

The latency and idempotency of the integration are important factors that affect these aspects. Therefore, the questions A and D are relevant for the integration design. The question B is related to the business logic of the order validation, which is not a system constraint question. The question C is related to the implementation details of the Outbound Messaging interface, which is not a system constraint question either

NEW QUESTION # 91

Northern Trail Outfitters needs to send order and line items directly to an existing finance application webservice when an order is fulfilled. It is critical that each order reach the finance application exactly once for accurate invoicing.

What solution should an architect propose?

- A. Button press invokes synchronous callout, with user handling retries in case of error
- B. Trigger makes @future Apex method, with custom error handling process.
- C. Outbound Messaging, which will automatically handle error retries to the service.
- **D. Trigger invokes Queueable Apex method, with custom error handling process.**

Answer: D

NEW QUESTION # 92

Northern Trail Outfitters (NTO) has recently changed their Corporate Security Guidelines. The guidelines require that all cloud applications pass through a secure firewall before accessing on-premise resources. NTO is evaluating middleware solutions to integrate cloud applications with on-premise resources and services.

What are two considerations an Integration Architect should evaluate before choosing a middleware solution?

Choose 2 answers

- **A. The middleware solution is capable of establishing a secure API gateway between cloud applications and on-premise resources.**
- B. The middleware solution is able to interface directly with databases via an ODBC connection string.
- C. The middleware solution enforces the OAuth security protocol.
- **D. An API gateway component is deployable behind a Demilitarized Zone (DMZ) or perimeter network.**

Answer: A,D

Explanation:

An API gateway is a component that acts as a single point of entry for all cloud applications to access on-premise resources and services. It can provide security, routing, transformation, and other features to facilitate integration. An API gateway component should be deployable behind a DMZ or perimeter network, which is a subnetwork that separates the internal network from the external network and provides an additional layer of security. The middleware solution should also be capable of establishing a secure API gateway between cloud applications and on-premise resources, which may involve using protocols such as HTTPS, SSL/TLS, or VPN. The OAuth security protocol is not a requirement for choosing a middleware solution, as it is a standard for authorizing access to resources on behalf of a user. The middleware solution's ability to interface directly with databases via an ODBC connection string is also not a requirement, as it is a specific feature that may or may not be needed depending on the integration scenario.
