Part 2

A group of different colored rectangular objects AI-generated content may be incorrect.

NEW QUESTION # 229

A technician upgrades a PC with two DIMMs, for a total of 32GB. After installing the two DIMMs, the user notices the OS is reporting only 16GB. Which of the following tasks should the technician perform to resolve the issue in the most rapid, cost-effective way possible?

- A. Reinstall RAM in different slots.
- B. Roll back recent system updates
- C. Update the OS to the latest version
- D. Replace the faulty motherboard

Answer: A

Explanation:

If newly installed RAM is not fully recognized, the most likely cause is incorrect installation or incompatible slots. Reseating or reinstalling the RAM modules in the correct slots can quickly resolve the issue without extra cost.

From CompTIA A+ 220-1101 Official Study Guide, Objective 3.2 - Install and configure PC components:

"If memory is not detected, check installation and reseal modules. Ensure they are placed in the correct, matched slots for dual-channel operation." Verified Source:

NEW QUESTION # 230

A customer reports slow network speeds. Which of the following components is most likely failing?

- A. CPU
- **B. NIC**
- C. RAM
- D. HDD

Answer: B

Explanation:

Comprehensive and Detailed In-Depth Explanation:

A Network Interface Card (NIC) is the hardware responsible for network connectivity. If the NIC is failing or underperforming (e.g., due to a bad driver, hardware fault, or misconfiguration), it can cause slow or unstable network speeds.

* Option A (CPU): A failing CPU affects overall system performance but not specifically network speed.

* Option C (HDD): A slow hard drive causes application lag, but not poor network performance.

* Option D (RAM): Affects multitasking and speed, not network throughput.

CompTIA A+ Core 1 Exam Objective Reference:

* Objective 3.5: Given a scenario, troubleshoot problems related to wired and wireless networks.

NEW QUESTION # 231

A customer built a computer for gaming, sourcing individual components and then assembling the system.

The OS starts up, but within a few minutes the machine locks up. The customer brought the computer to a technician to diagnose the issue.

Answer:

Explanation:

Explanation:

correct

answer is "Overclocking" and "Reduce CPU Clock speed" CPU is at 4.5 Ghz when normal is 3.2 Ghz.

Overclocking too much can cause freezes, and this is a gaming computer so the user probably took it too far.

NEW QUESTION # 232

A user reported performance issues on a computer after a recent OS update. A technician is confident that rolling back the system will resolve the issue. Which of the following steps should the technician take next?

- A. Verify full system functionality.
- B. Investigate any recent infrastructure changes.
- C. Document the findings.
- **D. Initiate the system restore.**

Answer: D

Explanation:

C: Initiate the system restore:

If the technician is confident that rolling back the system to a previous restore point will resolve the issue, the next logical step is to initiate the System Restore process.

System Restore allows the system to revert to a state before the OS update, which can eliminate the performance issues caused by the update.

Incorrect Options:

A: Document the findings: Documentation is important but should occur after resolving the issue.

B: Investigate any recent infrastructure changes: This is unnecessary if the issue is already attributed to the OS update.

D: Verify full system functionality: This step should be performed after the System Restore is completed.

Key Takeaway: When confident that rolling back will resolve the issue, the technician should proceed with initiating a System Restore to revert the OS.
