With our ISQI CTFL-AT practice questions, you can get the most out of your studying and maximize your chances of passing your ISQI CTFL-AT Exam. DumpsValid ISQI CTFL-AT practice test software is the answer if you want to score higher in the ISQI CTFL-AT exam and achieve your academic goals.

ISQI ISTQB Certified Tester - Foundation Level Extension - Agile Tester Sample Questions (Q13-Q18):

NEW QUESTION # 13

In a sprint planning, the product owner presents a user story written on a card. The team starts having a discussion with the product owner to get an understanding on how the software should work.

The user story written on the card is:

"As a customer, I want to subscribe to the mailing list so that I can receive the latest deal in an email." By applying the 3C concept, which ONE of the following statements is CORRECT?

- A. The card should contain requirements not the user story.
- **B. Conversation should include the acceptance criteria discussion.**
- C. Product owner has written a user story and confirmation is not needed.
- D. The conversation is not required and the team should start developing.

Answer: B

Explanation:

Explanation

The 3C concept of user stories consists of three elements: card, conversation, and confirmation¹². The card is a written description of the user story that captures the essence of the feature or functionality from the user's perspective. The conversation is a dialogue between the product owner and the development team to clarify the details, assumptions, and expectations of the user story. The confirmation is a set of criteria or tests that verify that the user story is implemented correctly and meets the user's needs¹². Therefore, by applying the 3C concept, the correct statement is A, as the conversation should include the acceptance criteria discussion. This will help the team to understand the scope, priority, and value of the user story, as well as the conditions of satisfaction that the product owner expects¹². The other statements are incorrect, as they violate the 3C concept. Statement B is wrong, as the card should contain the user story, not the requirements. The user story is a brief and informal way of expressing the user's goal and benefit, while the requirements are more detailed and specific descriptions of how the software should work. The requirements can be added later as part of the conversation or confirmation¹². Statement C is wrong, as the product owner has written a user story, but confirmation is still needed. The confirmation is a vital part of the 3C concept, as it ensures that the user story is testable, measurable, and verifiable. The confirmation also helps to avoid ambiguity, misunderstanding, or disagreement between the product owner and the development team¹². Statement D is wrong, as the conversation is required and the team should not start developing without it. The conversation is an essential part of the 3C concept, as it allows the team to ask questions, share ideas, and collaborate with the product owner to refine the user story and reach a shared understanding. The conversation also helps to identify the dependencies, risks, and assumptions that may affect the implementation of the user story¹². References: ISTQB Foundation Level Agile Tester Syllabus¹, Section 2.2.1, page 16-17; Effective User Stories - 3C's and INVEST Guide², Section The 3 C's (Card, Conversation, Confirmation) of User Stories.

NEW QUESTION # 14

In Agile projects, which of the following approaches would result in the best compromise for preserving independence of testers and for allowing testers to have a good understanding of the product as well as good relationships with other team members?

- A. Having independent separate test teams where all of the testers work separately from developers without being assigned to Agile teams
- B. Having only Agile teams where testers are integral parts and where they perform many of the testing tasks, without having an independent test team
- C. Having independent separate test teams where testers are assigned to Agile teams on-demand during the final days of each iteration
- **D. Having independent separate test teams where testers are assigned to Agile teams on a long-term basis, at the beginning of an Agile project**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From CTFL-AT Syllabus v4.0, Section 2.5 Testers and Independence, it states:

"Testers may be assigned to Agile teams on a permanent or rotating basis. While full independence is compromised, this setup allows for better collaboration and understanding of the product, while still maintaining some degree of independence." Thus, Option B is the most accurate - long-term embedded testers support Agile collaboration while preserving partial independence.

* Option A leads to involvement, which contradicts Agile principles.

* Option C sacrifices independence entirely.

* Option D is traditional and contrary to Agile values of collaboration.

Learning Objective (K2) - Understand approaches to preserving test independence in Agile

NEW QUESTION # 15

You have been asked to explain to your client how to define acceptance criteria that are fully testable. Which of the following is the BEST EXAMPLE for testable acceptance criteria?

- A. The interface to External System shall be specified.
- **B. The "ID" field must accept input value of a length between 2 and 10 characters.**
- C. The program's icon should be clear and attractive.
- D. Action "Reopen" must be available only for a user with a specific authorization level.

Answer: B

Explanation:

According to the ISTQB Tester Foundation Level Agile Tester syllabus, acceptance criteria are a set of conditions that a user story must satisfy to be accepted by the customer or stakeholder. Acceptance criteria should be testable, meaning that they can be verified by objective measurements or observations. Testable acceptance criteria should be clear, unambiguous, complete, and consistent.

Therefore, option A is the best example for testable acceptance criteria, as it specifies a clear and measurable condition for the input value of the ID field. Option B is not a good example for testable acceptance criteria, as it is vague and does not define any specific condition or expectation for the interface to External System. Option C is not a good example for testable acceptance criteria, as it is incomplete and does not specify what the specific authorization level is or how it is determined. Option D is not a good example for testable acceptance criteria, as it is subjective and not measurable. What is clear and attractive for one user may not be for another.

3 of 30

NEW QUESTION # 16

Which of the following statements about iteration and release planning is true?

- A. Release planning defines and re-defines the product backlog and provides the basis for a test approach and test plan spanning all iterations
- **B. During release planning, testers establish and prioritize the user stories for the release and then participate in the quality risk analysis for these stories**
- C. During release planning, testers add value by breaking down user stories into tasks (particularly testing tasks)
- D. Release plans cannot change as an Agile project proceeds, but iteration plans may change to accommodate new needs

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From the CTFL-AT Syllabus v4.0, Section 2.2 Release and Iteration Planning, testers actively contribute during release planning:

"During release planning, testers collaborate with the team to understand the scope of the release and help identify any high-level test considerations. They also participate in quality risk analysis and help in estimating test effort." Furthermore, it is noted:

"Testers are involved in defining and refining user stories and acceptance criteria, and contribute to quality risk assessments."

Therefore, Option C is accurate as it reflects the tester's involvement in prioritizing user stories and conducting quality risk analysis during release planning.

* Option A is incorrect because defining and redefining the product backlog is primarily the role of the Product Owner, and the test approach is iteration-specific, not fixed for the full release.

* Option B is inaccurate - breaking down stories into tasks is generally part of iteration (Sprint) planning, not release planning.

* Option Dis incorrect -release plans can change in Agile to accommodate changing business needs.

Learning Objective (K2) - Understand the role of the tester in release and iteration planning

NEW QUESTION # 17

An Agile team is developing a Pay-TV web portal. In Iteration 3, only PayPal and credit card payments are supported. A new user story in Iteration 4 adds payment using credit from a smartcard.

Which of the following would you expect to describe valid and relevant acceptance tests for this user story?

- A. Tests to check that payments with insufficient credit charged on the smartcard are successful
- B. Tests to check that payments with expired credit cards of supported credit card types are unsuccessful
- **C. Tests to check that payments with no credit charged on the smartcard will be unsuccessful**
- D. Tests to check that payments with sufficient credit charged on the smartcard are given five percent discount are successful

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

From CTFL-AT Syllabus v4.0, Section 2.1 Acceptance Criteria and Testability, acceptance tests must be directly related to the new functionality described in the user story.

* Option Dis correct - it validates the new feature of paying via smartcard credit, specifically handling edge cases (e.g., zero credit).

* Option A is incorrect - payment should fail with insufficient credit.

* Option B introduces requirements not mentioned in the story.

* Option C tests credit card logic, not the new smartcard functionality.
