## Development-Lifecycle-and-Deployment-Architect Cert Exam & Development-Lifecycle-and-Deployment-Architect Free Sample Questions

Prep4SureReview free update our training materials, which means you will always get the latest Development-Lifecycle-and-Deployment-Architect exam training materials. If Development-Lifecycle-and-Deployment-Architect exam objectives change, The learning materials Prep4SureReview provided will follow the change. Prep4SureReview know the needs of each candidate, we will help you through your Development-Lifecycle-and-Deployment-Architect Exam Certification. We help each candidate to pass the exam with best price and highest quality.

To become a Salesforce Certified Development Lifecycle and Deployment Architect, candidates must have vast knowledge of critical aspects of Salesforce such as Apex, Visualforce, Lightning Components, security, and integration. However, more than just the technical aspects, the exams also cover architecture principles, best practices, and various methodologies that professionals must include in their Salesforce solutions. Being certified as a Development Lifecycle and Deployment Architect will provide individuals with validation of their Salesforce knowledge and become an essential factor in advancing their career as a Salesforce expert.

Salesforce Development-Lifecycle-and-Deployment-Architect Certification Exam covers a wide range of topics, including application design, data modeling, integration, testing, deployment, and security. It is a comprehensive exam that requires candidates to demonstrate their proficiency in all aspects of the Salesforce development lifecycle. Development-Lifecycle-and-Deployment-Architect exam consists of multiple-choice questions and scenarios that test candidates' ability to design and develop complex Salesforce applications that meet business requirements, adhere to best practices, and are scalable and maintainable.

## Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q72-Q77):

### NEW QUESTION # 72

Universal Container has multiple departments who use Salesforce and request changes: Sales, Service, Back Office, Marketing, etc. Each of these departments makes independent purchase decisions for AppExchange apps, field requests, and page layouts, resulting in low adoption and under-use of standard Salesforce capabilities. What mechanism should a Technical Architect recommend to increase use of standard Salesforce functionality?

- A. Change Control Board
- B. Project Management Office
- C. Center of Excellence
- D. Requirements Traceability Matrix

**Answer: C**

### NEW QUESTION # 73

Universal Containers (UC) has created a custom REST web service. This web service receives Orders and Order Line Items data from an external endpoint and runs business logic and validations on it before inserting it into the database. UC is expecting to receive more than 100K orders a day and each order can have up to 10 line items. Each inbound request will contain only one order and its corresponding line items.

What two testing types should an architect recommend to ensure users don't face platform slowdowns during peak business hours? Choose 2 answers

- A. Unit Testing
- B. Performance Testing
- C. Load Testing
- D. Stress Testing

**Answer: B,C**

### NEW QUESTION # 74

Universal Containers (UC) uses a managed package to install an internal Sales app in five orgs. Within each org there are integrations and local processes with the objects of the managed package. UC wants to use unlocked packages for better integration with CI/CD processes.

What would the Salesforce architect recommend for this migration?

- A. Export all data from objects/fields of the managed package, uninstall it, install the unlocked package with the same namespace as the Managed package and restore all data.
- B. Export all data from objects/fields of the managed package, uninstall it, install the unlocked package without namespace and restore all data.
- C. Migrate all classes, Visualforce, and components from the managed package to the unlocked package. Install the new version of the managed package (objects/fields only) and the unlocked package with the other components.
- D. Do not change to unlocked package as it is possible to perform all CI/CD processes with the managed package.

**Answer: C**

Explanation:

Explanation

The best way to migrate from a managed package to an unlocked package is to split the components into two packages: one for the objects and fields, and one for the classes, Visualforce, and other components. This way, the data and integrations with the objects and fields of the managed package are preserved, and the classes and Visualforce can be modified and deployed using CI/CD processes with the unlocked package. Exporting and restoring the data from the managed package is not a feasible solution, as it would require a lot of effort and risk data loss or corruption. Installing the unlocked package with the same namespace as the managed package is not possible, as namespaces are unique and cannot be reused. Staying with the managed package is not a good option, as it does not allow for better integration with CI/CD processes.

### NEW QUESTION # 75

UC's scale of Salesforce deployment has increased over time, leading to complexities. UC is finding too many bugs in the deployed code, which has become a challenge to the delivery team. The team wants to reduce the amount of bugs by ensuring all the

developed code is reviewed, tested, and validated in the upstream deployment process. Which three development practices will be best suited to address UC's concerns? Choose 3

- A. Use continuous integration with automation testing.
- B. Enable developer teams to do peer code review.
- C. Incorporate test-driven deployment into the project structure.
- D. Encourage the development team to be self-organizing.
- E. Enable a short and timely feedback loop with customers

Answer: A,B,C

#### NEW QUESTION # 76

Universal Containers (UC) is implementing Service Cloud UC's contact center receives 100 phone calls per hour and operates across North America, Europe and APAC regions. UC wants the application to be responsive and scalable to support 150 calls considering future growth. what should be recommended test load consideration

- A. Testing load considering current call volume.
- B. Testing load considering 10x the current call volume.
- C. Testing load considering 50% more call volume.
- D. Testing load considering half the call volume.

Answer: C

Explanation:

Testing load considering 50% more call volume is a reasonable test load consideration, as it can simulate the expected future growth and ensure that the application can handle the increased demand without compromising the performance or functionality.

#### NEW QUESTION # 77
