Valid Braindumps SPLK-1002 Sheet, SPLK-1002 Reliable Exam Book

Are you still worried about the actuality and the accuracy of the SPLK-1002 exam cram? If you choose us, there is no necessary for you to worry about this problem, because we have the skilled specialists to compile as well check the SPLK-1002 Exam Cram, which can ensure the right answer and the accuracy. The pass rate is 98%, if you have any other questions about the SPLK-1002 dumps after buying, you can also contact the service stuff.

SPLK-1002 Exam Content

The domains to check out for SPLK-1002 test along with their details are outlined below. However, this guideline is not a rigid structure of what the test has. Candidates are required to study widely so they become fully prepared. The content of SPLK-1002 can be altered without notifying them.

- Creation of data models (10%)
- Use of the CIM (10%)
- Application of transformational commands in visualizations (5%)
- Creation and management of fields (10%)
- Correlating events (15%)

In the first section, the Splunk SPLK-1002 exam will test the candidates on how they can use the chart and timechart commands. Then in the questions related to the second domain, they will also be checked on their knowledge of eval command, how well they can apply the search as well as the where command to filter outcomes, and their understanding of the fillnull command. In the third domain, the candidates will have to showcase their skills in the identification of transactions, using fields for group events, making transactions with search, making reports on the transactions, and deciding between the use of transactions and statistics according to a given scenario.

The fourth, fifth, and sixth topics of SPLK-1002 will also go to appraising the candidate's knowledge of the fields and other features. They highlight areas such as the use of the Field Extractor (FX) for performing regex field extractions and using the FX to do delimiter field extractions. The candidate will also be gauged on their knowledge of describing, creating, and utilizing field aliases as well as calculated fields. Finally, one's understanding of the creation and use of tags will be assessed, along with the knowledge of event types, their different uses, and the skills in their creation.

The test will also measure the candidate's awareness of macros, the creation as well as the use of basic macros, defining variables and arguments for macros, and adding and using those arguments. Under the eighth domain, one has to show the knowledge of diverse functions such as GET, POST as well as Search workflow actions, and demonstrate skills in their creation.

In the last two modules, the exam-takers will also be required to prove their expertise in the creation of data models and utilizing CIM. These include an understanding of the connection between pivot and data models, the creation of data models, and the ability to define the attributes. Also, the candidates have to be competent in normalizing data with the help of CIM, be familiar with the CIM Add-On knowledge objects, and the basic features of this solution.

Splunk Core Certified Power User Exam Sample Questions (Q69-Q74):

NEW QUESTION # 69

Which of the following is the correct way to use the data model command to search field in the data model within the web dataset?

- A. `Datamodel=web | search web | filed web*`
- B. `| datamodel web search | filed web *`
- C. `| datamodel web web field | search web*`
- D. `| Search datamodel web web | filed web*`

Answer: B

Explanation:

The data model command allows you to run searches on data models that have been accelerated¹. The syntax for using the data model command is `| datamodel <model_name> <dataset_name> [search <search_string>]`¹. Therefore, option A is the correct way to use the data model command to search fields in the data model within the web dataset. Options B and C are incorrect because they do not follow the syntax for the data model command. Option D is incorrect because it does not use the data model command at all.

NEW QUESTION # 70

What is the correct syntax to find events associated with a tag?

- A. `tags=<value>`
- B. `tags:<field>=<value>`
- C. `tag=<value>`
- D. `tag:<field>=<value>`

Answer: C

Explanation:

The correct syntax to find events associated with a tag in Splunk is `tag=<value>`¹. So, the correct answer is D. `tag=<value>`. This syntax allows you to annotate specified fields in your search results with tags¹.

In Splunk, tags are a type of knowledge object that you can use to add meaningful aliases to field values in your data¹. For example, if you have a field called `status_code` in your data, you might have different status codes like 200, 404, 500, etc. You can create tags for these status codes like `success` for 200, `not_found` for 404, and `server_error` for 500. Then, you can use the `tag` command in your searches to find events associated with these tags¹.

Here is an example of how you can use the `tag` command in a search:

```
index=main sourcetype=access_combined | tag status_code
```

In this search, the `tag` command annotates the `status_code` field in the search results with the corresponding tags. If you have tagged the status code 200 with `success`, the status code 404 with `not_found`, and the status code 500 with `server_error`, the search results will include these tags¹.

You can also use the `tag` command with a specific tag value to find events associated with that tag. For example, the following search finds all events where the status code is tagged with `success`:

index=main sourcetype=access_combined | tag status_code | search tag::status_code=success
In this search, the tag command annotates the status_code field with the corresponding tags, and the search command filters the results to include only events where the status_code field is tagged with success.

NEW QUESTION # 71

Consider the following search:

```
index=web sourcetype=access_combined
```

The log shows several events that share the same jsessionid value (SD462K101O2F267). View the events as a group. From the following list, which search groups events by jsessionid?

- A. index=web sourcetype=access_combined JSESSIONID <SD462K101O2F267>
- B. index=web sourcetype=access_combined | highlight JSESSIONID | search SD462K101O2F267
- C. index=web sourcetype=access_combined SD462K101O2F267 | table JSESSIONID
- D. index=web sourcetype=access_combined | transaction JSESSIONID | search SD462K101O2F267

Answer: D

Explanation:

The transaction command groups events that share a common value in a specified field, such as JSESSIONID, and that occur within a specified time range. The search command filters the results to show only the events that match the given value of JSESSIONID. This search groups the events by JSESSIONID and then shows only the events that have the value SD462K101O2F267 for JSESSIONID.

1: Splunk Core Certified Power User Track, page 9. 2: Splunk Documentation, transaction command.

NEW QUESTION # 72

What functionality does the Splunk Common Information Model (CIM) rely on to normalize fields with different names?

- A. The rename command.
- B. Macros.
- C. Field aliases.
- D. CIM does not work with different names for the same field.

Answer: C

Explanation:

The Splunk Common Information Model (CIM) add-on helps you normalize your data from different sources and make it easier to analyze and report on it. One of the functionalities that the CIM add-on relies on to normalize fields with different names is field aliases. Field aliases allow you to assign an alternative name to an existing field without changing the original field name or value. By using field aliases, you can map different field names from different sources or sourcetypes to a common field name that conforms to the CIM standard. Therefore, option B is correct, while options A, C and D are incorrect.

NEW QUESTION # 73

Historical searches provide a static snapshot of events at a given time.

- A. True
- B. False

Answer: A

NEW QUESTION # 74
