WGUSecure Software Design (KEO1) Exam Sample Questions (Q61-Q66):

NEW QUESTION # 61

The security team is reviewing whether changes or open issues exist that would affect requirements for handling personal information documented in earlier phases of the development life cycle.

Which activity of the Ship SDL phase is being performed?

- A. Final privacy review
- B. Vulnerability scan
- C. Final security review
- D. Open-source licensing review

Answer: A

Explanation:

The activity being performed is the final privacy review. This step is crucial in the Ship phase of the Security Development Lifecycle (SDL), where the security team assesses if there are any changes or unresolved issues that could impact the requirements for handling personal information. These requirements are typically documented in the earlier stages of the development lifecycle, and the final privacy review ensures that the software complies with these requirements before release.

: The explanation is based on the best practices outlined in the SDL Activities and Best Practices, which detail the importance of conducting a final privacy review during the Ship phase to ensure that all privacy issues have been addressed¹².

NEW QUESTION # 62

Which software control test examines the internal logical structures of a program and steps through the code line by line to analyze the program for potential errors?

- A. Black box testing
- B. Reasonableness testing
- C. White box testing
- D. Dynamic testing

Answer: C

Explanation:

White box testing, also known as clear box testing, glass box testing, transparent box testing, and structural testing, is a method of software testing where the internal structure, design, and coding of the software are tested to verify the flow of input-output and to improve the design, usability, and security. It involves looking at the structures that are internal to the system, with the tester having knowledge of the internal workings of the product. This type of testing is concerned with examining the internal logical structures of the program and is typically performed by stepping through the code line by line to analyze the program for potential errors, which aligns with the description of the control test in question.

NEW QUESTION # 63

Which mitigation technique can be used to fight against a denial of service threat?

- A. Digital signatures
- B. Protect secrets
- C. Timestamps
- **D. Throttling**

Answer: D

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Throttling is a common and effective mitigation technique against Denial of Service (DoS) attacks. It limits the number of requests a user or IP can send over a certain time period, preventing resource exhaustion. This reduces the risk of overwhelming servers, which is the core issue in DoS attacks. Digital signatures (A) protect data integrity and authenticity, Protect secrets (B) secures confidential information, and Timestamps (C) help prevent replay attacks but are not direct defenses for DoS. According to NIST SP 800-61 Rev. 2 (Computer Security Incident Handling Guide) and OWASP DoS Prevention, throttling and rate limiting are standard controls to maintain availability under attack conditions.

NEW QUESTION # 64

Which secure coding best practice says to require authentication before allowing any files to be uploaded and to limit the types of files to only those needed for the business purpose?

- **A. File management**
- B. Communication security
- C. Data protection
- D. Memory management

Answer: A

Explanation:

The secure coding best practice that requires authentication before allowing any files to be uploaded, and limits the types of files to only those needed for the business purpose, falls under the category of File Management. This practice is crucial for preventing unauthorized file uploads, which can be a common vector for attacks such as uploading malicious files or scripts. By enforcing authentication, the application ensures that only legitimate users can upload files. Additionally, restricting the file types to those necessary for business operations minimizes the risk of uploading potentially harmful files that could compromise the system.
