

Hottest SOA-C03 Certification - Quiz First-grade

Amazon SOA-C03 Reliable Exam Topics

Users of this format don't need to install excessive plugins or software to attempt the SOA-C03 web-based practice exams. Another format of the SOA-C03 practice test is the desktop-based software. This SOA-C03 Exam simulation software needs installation only on Windows computers to operate. The third format of the Exams-boost Amazon SOA-C03 exam dumps is the SOA-C03 Dumps PDF.

You can take advantage of several perks if you buy Exams-boost's bundle package of Amazon SOA-C03 dumps. The bundle package is cost-effective and includes all three formats of AWS Certified CloudOps Engineer - Associate exam preparation material Amazon SOA-C03 PDF Dumps Questions Answers, and Amazon SOA-C03 Practice Test software (online and offline). Amazon SOA-C03 Dumps are worth trying while preparing for the exam. You will be sure of what Amazon SOA-C03 exam questions will be asked in the exam.

Top Features of Exams-boost Amazon SOA-C03 PDF Questions File and Practice Test Software

The pages of our SOA-C03 guide torrent provide the demo and you can understand part of our titles and the form of our software. On the pages of our SOA-C03 exam torrent you can see the version of the product, the updated time, the quantity of the questions

and answers, the characteristics and merits of the product, the price of the product and the discounts. The pages also list the details and the guarantee of our SOA-C03 Exam Torrent, the methods to contact us, the evaluations of the past client on our product, the related exams and other information about our SOA-C03 guide torrent. So before your purchase you can have an understanding of our product and then decide whether to buy our SOA-C03 study questions or not.

Amazon AWS Certified CloudOps Engineer - Associate Sample Questions (Q83-Q88):

NEW QUESTION # 83

An Amazon EC2 instance is running an application that uses Amazon Simple Queue Service (Amazon SQS) queues. A CloudOps engineer must ensure that the application can read write, and delete messages from the SQS queues.

Which solution will meet these requirements in the MOST secure manner?

- A. Create an IAM user with an IAM policy that allows the `sqs:SendMessage` permission, the `sqs:ReceiveMessage` permission, and the `sqs:DeleteMessage` permission to the appropriate queues. Embed the IAM user's credentials in the application's configuration.
- B. Create an IAM user with an IAM policy that allows the `sqs:SendMessage` permission, the `sqs:ReceiveMessage` permission, and the `sqs:DeleteMessage` permission to the appropriate queues. Export the IAM user's access key and secret access key as environment variables on the EC2 instance.
- C. Create and associate an IAM role that allows EC2 instances to call AWS services. Attach an IAM policy to the role that allows `sqs:*` permissions to the appropriate queues.
- **D. Create and associate an IAM role that allows EC2 instances to call AWS services. Attach an IAM policy to the role that allows the `sqs:SendMessage` permission, the `sqs:ReceiveMessage` permission, and the `sqs:DeleteMessage` permission to the appropriate queues.**

Answer: D

Explanation:

The most secure approach is to use an IAM role for EC2 (no long-lived credentials) and grant only the specific SQS actions needed (send, receive, delete) on the required queues. The instance automatically receives temporary credentials via the role, enforcing least privilege and avoiding hard-coded or environment-stored access keys.

NEW QUESTION # 84

A company has a critical serverless application that uses multiple AWS Lambda functions. Each Lambda function generates 1 GB of log data daily in its own Amazon CloudWatch Logs log group. The company's security team asks for a count of application errors, grouped by type, across all of the log groups.

What should a CloudOps engineer do to meet this requirement?

- A. Perform a CloudWatch Logs search that uses the `groupby` keyword and `count` function.
- **B. Perform a CloudWatch Logs Insights query that uses the `stats` command and `count` function.**
- C. Perform an Amazon RDS query that uses the `SELECT` and `GROUP BY` keywords.
- D. Perform an Amazon Athena query that uses the `SELECT` and `GROUP BY` keywords.

Answer: B

Explanation:

CloudWatch Logs Insights is purpose-built for querying and aggregating log data across multiple log groups. Using the `stats` command with the `count()` function allows the CloudOps engineer to efficiently group and count specific error types from all Lambda log groups in one query, providing an aggregated view of application errors with minimal effort and without data export or external tools.

NEW QUESTION # 85

A company runs custom statistical analysis software on a cluster of Amazon EC2 instances. The software is highly sensitive to network latency between nodes, although network throughput is not a limitation.

Which solution will minimize network latency?

- **A. Place all the EC2 instances into a cluster placement group.**
- B. Place all the EC2 instances into a spread placement group in the same AWS Region.

- C. Configure jumbo frames on all the EC2 instances in the cluster.
- D. Configure and assign two Elastic IP addresses for each EC2 instance.

Answer: A

Explanation:

The AWS Cloud Operations and Compute documentation explains that placement groups control how EC2 instances are physically arranged within AWS data centers to optimize network performance.

Cluster placement groups place instances physically close together within a single Availability Zone, connected through high-bandwidth, low-latency networking (ideal for tightly coupled, HPC, or distributed workloads).

Spread placement groups distribute instances across distinct racks or Availability Zones for fault tolerance, increasing latency.

Partition placement groups separate instances into partitions for isolation, not latency reduction.

Therefore, to minimize latency for workloads such as computational clusters, the CloudOps engineer should use a cluster placement group. This placement ensures single-digit microsecond latency and enhanced packet rate performance between instances.

Elastic IPs (Option B) do not influence internal networking. Jumbo frames (Option C) can marginally improve throughput but do not reduce propagation latency. Spread placement (Option D) increases distance, worsening latency.

Hence, Option A -- using a cluster placement group -- delivers the lowest possible network latency and is AWS's best-practice design for HPC-style clusters.

NEW QUESTION # 86

A CloudOps engineer is maintaining a web application using an Amazon CloudFront web distribution, an Application Load Balancer (ALB), Amazon RDS, and Amazon EC2 in a VPC. All services have logging enabled. The CloudOps engineer needs to investigate HTTP Layer 7 status codes from the web application.

Which log sources contain the status codes? (Choose two.)

- A. RDS logs
- B. VPC Flow Logs
- C. AWS CloudTrail logs
- **D. ALB access logs**
- **E. CloudFront access logs**

Answer: D,E

Explanation:

ALB access logs include detailed HTTP Layer 7 information such as request paths, user agents, and status codes returned by the application.

CloudFront access logs record all viewer requests served through CloudFront distributions, including HTTP status codes (2xx, 4xx, 5xx).

These two log sources together provide complete visibility into HTTP status code behavior from both the edge (CloudFront) and origin (ALB) layers, allowing the CloudOps engineer to investigate web application performance and errors effectively.

NEW QUESTION # 87

A company hosts a static website in an Amazon S3 bucket, accessed globally via Amazon CloudFront.

The Cache-Control max-age header is set to 1 hour, and Maximum TTL is set to 5 minutes. The CloudOps engineer observes that CloudFront is not caching objects for the expected duration.

What is the reason for this issue?

- A. The Expires header has been set to 3 hours.
- B. Cached assets are not expiring in the edge location.
- **C. Cache-duration settings conflict with each other.**
- D. Cache invalidation is missing in the CloudFront configuration.

Answer: C

Explanation:

As per the AWS Cloud Operations and Content Delivery documentation, CloudFront determines cache behavior by evaluating both origin headers (e.g., Cache-Control and Expires) and distribution-level TTL settings.

When Cache-Control max-age conflicts with the Maximum TTL configured in CloudFront, the shorter TTL value takes precedence. This results in CloudFront caching content for only 5 minutes instead of 1 hour, despite the origin headers suggesting a longer

duration.

AWS documentation explicitly states: "When both origin cache headers and CloudFront TTL settings are defined, CloudFront uses the most restrictive caching period." This mismatch causes the perceived performance drop, as CloudFront frequently revalidates content.

Therefore, Option D is correct -- cache-duration settings conflict with each other, leading to unexpected caching behavior.

NEW QUESTION # 88

.....

Therefore, you must prepare as per the changes of the Amazon SOA-C03 real test. For your assistance, Exams-boost offers free real Amazon SOA-C03 dumps updates if Amazon Certification Exams changes the SOA-C03 examination content within 365 days of your purchase. These free SOA-C03 dumps updates will prevent you from mental stress, wasting time, and losing money.
