Because the Test4Engine exam information will be able to help you pass the test. It provides the information which is up to date. With Test4Engine Lpi 010-160 Test Questions, you will become full of confidence and not have to worry about the exam. However, it lets you get certified effortlessly.

Lpi Linux Essentials Certificate Exam - version 1.6 Sample Questions (Q31-Q36):

NEW QUESTION # 31
Which of the following commands puts the lines of the file data.csv into alphabetical order?

- A. wc -s data.csv
- B. grep --sort data.csv
- C. a..z data.csv
- D. abc data.csv
- E. sort data.csv

Answer: E

NEW QUESTION # 32
What is true about the dmesg command? (Choose two correct answers.)

- A. It displays the content of the Linux kernel's ring buffer.
- B. It might not display older information because it was overwritten by newer information.
- C. It traces the execution of a command and shows each step the program carries out.
- D. It sends messages to the command lines of all current user sessions.
- E. It immediately outputs all new messages written to the system journal.

Answer: A,B

Explanation:
The dmesg command is used to display the messages from the kernel that are stored in a ring buffer. A ring buffer is a fixed-size data structure that overwrites the oldest entries when it is full. Therefore, the dmesg command might not display older information because it was overwritten by newer information. The dmesg command is useful for troubleshooting system issues and checking hardware information. The dmesg command is not used to trace the execution of a command, send messages to user sessions, or output the system journal. Those functions are performed by other commands such as strace, write, and journalctl respectively. Reference: : [dmesg] : [Ring buffer] : [strace] : [write (Unix)] : [journalctl]4)

NEW QUESTION # 33
What is true about links in a Linux file system?

- A. When the target of the symbolic link is moved, the link is automatically updated.
- B. A symbolic link can point to a file on another file system.
- C. A symbolic link can only point to a file and not to a directory.
- D. Only the root user can create hard links.
- E. A hard link can only point to a directory and never to a file.

Answer: B

NEW QUESTION # 34
Which of the following commands sets the variable USERNAME to the value bob?

- A. $USERNAME==bob
- B. set USERNAME bob
- C. USERNAME<=bob
- D. USERNAME=bob
- E. var USERNAME=bob

Answer: D

Explanation:
The correct command to set the variable USERNAME to the value bob is USERNAME=bob. This command assigns the string

bob to the variable name USERNAME, using the equal sign (=) as the assignment operator. There is no space around the equal sign, and the variable name and value are case-sensitive. This command sets a shell variable, which is only valid in the current shell session. To make the variable an environment variable, which can be inherited by child processes and subshells, you need to use the export command, such as export USERNAME=bob. The other commands are not valid for setting variables in Linux. The set command is used to set or unset shell options and positional parameters, not variables. The $ sign is used to reference the value of a variable, not to assign it. The == sign is used for comparison, not assignment. The var keyword is not used in Linux, but in some other programming languages. The <= sign is used for redirection, not assignment. Reference:

NEW QUESTION # 35

Which of the following directories must be mounted with read and write access if it resides on its own dedicated file system?

- A. /etc
- B. /usr
- C. /lib
- D. /var
- E. /opt

Answer: D

Explanation:
The /var directory must be mounted with read and write access if it resides on its own dedicated file system. The reason is that the /var directory contains files and directories that are expected to change in size and content as the normal operation of the system progresses, such as logs, spool files, and temporary files1. Therefore, the /var directory needs to have enough space and permission to accommodate these changes. If the /var directory is mounted as read-only, some system services and applications may fail to start or function properly2.
The other options are not directories that must be mounted with read and write access if they reside on their own dedicated file system. The /opt directory contains optional or third-party software packages that are not part of the default installation1. The /lib directory contains libraries and kernel modules that are essential for the binaries in /bin and /sbin directories1. The /etc directory contains configuration files for the system and applications1. The /usr directory contains user-related programs, libraries, documentation, and data1. These directories are usually mounted as read-only to prevent accidental or malicious modification of their contents3. Reference:
