The language which is easy to be understood and simple, 3V0-23.25 exam questions are suitable for any learners no matter he or she is a student or the person who have worked for many years with profound experiences. So it is convenient for the learners to master the 3V0-23.25 Guide Torrent and pass the exam in a short time. The amount of the examinee is large. For the office workers, they are both busy in their job and their family life; for the students, they possibly have to learn or do other things.

For consolidation of your learning, our PDF, Software and APP online versions of the 3V0-23.25 exam questions also provide you with different sets of practice questions and answers. Doing all these sets of the 3V0-23.25 study materials again and again, you enrich your knowledge and maximize chances of an outstanding exam success. And the content of the three version is the same, but the displays are totally different. If you want to know them before the payment, you can free download the demos of our 3V0-23.25 learning braindumps.

3V0-23.25 Exam Tests & 3V0-23.25 Latest Exam Camp

The price for VMware 3V0-23.25 exam materials is reasonable, and no matter you are a student at school or an employee in the company, you can afford it. Besides, Advanced VMware Cloud Foundation 9.0 Storage 3V0-23.25 Exam Materials are compiled by skilled professionals, and they are familiar with the exam center, therefore the quality can be guaranteed.

VMware Advanced VMware Cloud Foundation 9.0 Storage Sample Questions (Q100-Q105):

NEW QUESTION # 100

A CTO is evaluating how to handle Site Maintenance and Site Failover testing for a VCF Stretched Cluster. The infrastructure team prefers using vSphere Distributed Resource Scheduler (DRS) Host/Site Affinity rules to automate VM movements, rather than using SRM.

The CTO examines the architectural trade-offs of relying purely on DRS rules versus an SRM Recovery Plan.

Which of the following statements accurately describe the trade-offs and mechanics of using DRS Affinity Rules for Site Failover in a Stretched Cluster? (Select all that apply.)

- A. DRS site affinity rules automatically override the vSAN "Site Locality" algorithm, forcing data components to migrate to the same site as the compute.
- B. A primary limitation of DRS-based failover is that it cannot control the startup order (IP address updates, dependencies) of virtual machines after they restart on the remote site.
- C. "Should run on Preferred Site" affinity rules allow VMs to be easily vMotioned to the Secondary Site for maintenance, and vSphere HA will still restart them on the Secondary Site during a real disaster.
- D. SRM testing requires pausing the vSAN synchronous mirror, whereas DRS-based testing allows VMs to move freely between sites without breaking RPO.
- E. "Must run on Preferred Site" affinity rules are an anti-pattern for DR; if the Preferred Site fails, vSphere HA is strictly forbidden from restarting these VMs on the Secondary Site, negating the disaster recovery value.

Answer: B,C,E

NEW QUESTION # 101

A SOC Analyst is investigating a massive CPU utilization spike on a VCF 9.0 ESXi host immediately after a Supplemental NFS v4.1 Datastore was mounted. The principal storage is vSAN ESA.

...

[Log Snippet: vmkernel.log - ESXi Host]

2026-11-20T11:00:00Z INFO tcp_ip - [NFS] IP Fragmentation event detected.

2026-11-20T11:00:05Z WARN cpu_sched - [Hostd] CPU 01 saturation: 99% (Processing network interrupts).

...

The Physical Network switch is configured for standard MTU 1500.

What is strictly causing this configuration to cripple the ESXi host CPU, assuming the storage traffic is high volume? (Select all that apply.)

- A. Because the host is sending 9000-byte packets and the physical switch only supports 1500-byte packets, the ESXi network stack is forced to violently fragment every storage packet into 6 smaller packets.
- B. The CPU is consumed by the Top-of-Rack switch's native ASIC routing protocol.
- C. The fragmentation and subsequent reassembly of massive NFS payload data consumes astronomical amounts of ESXi CPU cycles (Interrupt Requests), starving the hostd management agent and the vSAN DOM of compute resources.
- D. The ESXi host automatically triggers a "Deep Rekey" operation when MTU mismatches are detected to ensure the fragmented packets remain encrypted.
- E. The VMkernel port used for the NFS datastore was mistakenly configured with MTU 9000 (Jumbo Frames).

Answer: A,C,E

NEW QUESTION # 102

Which statement accurately defines the fundamental architectural model of vSAN File Services and how it converts standard block-based HCI into a Network Attached Storage (NAS) appliance?

- A. vSAN File Services requires a dedicated ESXi host outside of the HCI cluster running a monolithic Linux file server that translates the vSAN iSCSI protocol into NFS.
- B. The feature strictly utilizes Windows Server Active Directory virtual machines installed manually by the administrator to manage the SMB protocol translations.
- C. vSAN File Services operates strictly at the physical network switch layer using RDMA; it bypasses the ESXi CPU entirely to achieve NAS speeds.
- D. vSAN File Services deploys a hidden "File Service Virtual Machine" (FSVM) appliance on *every* ESXi host in the cluster; these FSVMs use the vSAN Distributed File System (VDFS) to pool the underlying vSAN objects and expose them externally as NFS or SMB shares.

Answer: D

NEW QUESTION # 103

An Infrastructure Manager is sizing the "Operations Reserve" for a VCF 9.0 Workload Domain. The developers plan to use vSAN Data Protection with highly aggressive snapshot schedules for their CI/CD pipelines (e.g., snapshots every 15 minutes, retaining 48 hours).

...

[SDDC Manager - Capacity Configuration]

Default vSAN Thresholds

Host Rebuild Reserve: 15% (Enabled)

Operations Reserve: 5% (Customized)

...

Historically, the manager lowered the Operations Reserve to 5% to grant more capacity to VMs.

How does the interaction of heavy snapshot activity and this customized Operations Reserve directly impact the cluster's stability and performance? (Select all that apply.)

- A. Deep snapshot chains generate significant metadata overhead; when background snapshot deletions occur, they consume temporary staging space which can quickly exhaust a 5% Operations Reserve.
- B. The system will fail to delete older snapshots when the retention limit is reached if the Operations Reserve is full, causing the datastore to rapidly fill to 100%.
- C. vSAN ESA snapshots do not consume Operations Reserve space because they are log-structured B- tree pointers, making the 5% setting perfectly safe.
- D. If the Operations Reserve is exhausted by snapshot consolidation overhead, vSAN will throttle incoming VM write I/O to zero to prevent datastore corruption.

Answer: A,B,D

NEW QUESTION # 104

A VCF Deployment Specialist is investigating why a newly provisioned File Server on a vSAN OSA cluster is capped at exactly 5,000 IOPS, despite the host NVMe cache drives having substantial headroom.

The specialist reviews the active Storage Policy associated with the VMDK.

...

SPBM Configuration

Name: VDI-Restricted-Policy

Capabilities:

FailuresToTolerate: 1 (RAID-1)

StripeWidth: 2

IOPSLimit: 5000

ForceProvisioning: False

...

According to the vSAN troubleshooting methodology, how does this specific SPBM configuration mechanically enforce the limit, and where should the specialist look to verify if the VM is hitting it?

(Choose 2.)

- A. The StripeWidth: 2 rule divided the 5,000 IOPS limit across two hosts, meaning each host is effectively limited to 2,500 IOPS.
- B. The IOPS Limit is enforced at the vSAN DOM Client layer (on the host where the VM resides), which intentionally delays (throttles) the I/O entering the vSAN network.
- C. The specialist can confirm this bottleneck by checking the "DOM Client" latency charts in vCenter; IOPS limits manifest as artificial high latency at the DOM Client without corresponding backend network or LSOM latency.
- D. The IOPS Limit acts as a Quality of Service (QoS) threshold enforced strictly at the vSCSI layer inside the Guest OS.

Answer: B,C

NEW QUESTION # 105
