SPLK-1002 Exam Online & Valid SPLK-1002 Exam Papers

Our company constantly increases the capital investment on the research and innovation of our SPLK-1002 study materials and expands the influences of our study materials in the domestic and international market. Because the high quality and passing rate of our SPLK-1002 study materials more than 90 percent that clients choose to buy our study materials when they prepare for the test SPLK-1002 Certification. We have established a good reputation among the industry and the constantly-enlarged client base. Our sales volume and income are constantly increasing and the clients' credibility towards our SPLK-1002 study materials stay high.

Splunk Core Certified Power User Exam Sample Questions (Q224-Q229):

NEW QUESTION # 224
How is an event type created from the search window? (select all that apply)

- A. In an event's detail dropdown, click Event Actions > Build Event Type.
- B. Edit eventtypes.conf and add a new stanza.
- C. In the top right corner, click Save As > Event Type.
- D. Add | eventtype to the SPL and execute the search.

Answer: B,C

Explanation:
In Splunk, you can create an event type from the search window by running a search that would make a good event type, then clicking Save As and selecting Event Type1. This opens the Save as Event Type dialog, where you can provide the event type name and optionally apply tags to it1.
You can also create an event type by editing the eventtypes.conf file and adding a new stanza1. Each stanza in the eventtypes.conf file represents an event type1. The stanza name is the name of the event type, and the search attribute specifies the search string that defines the event type1.

It's important to note that while you can use the eventtype command in a search to find events associated with a specific event type, adding | eventtype to the SPL and executing the search does not create a new event type1. Similarly, clicking Event Actions > Build Event Type in an event's detail dropdown does not create a new event type1.

NEW QUESTION # 225

How could the following syntax for the chart command be rewritten to remove the OTHER category? (select all that apply)
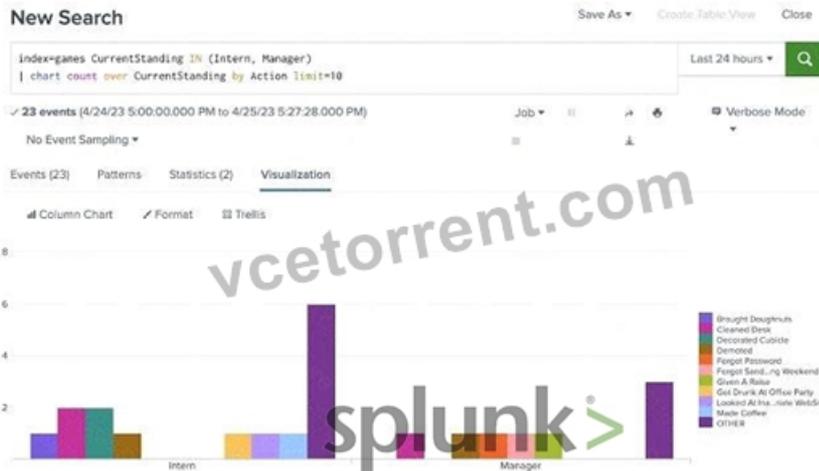

- A. | chart count over CurrentStanding by Action limit=10 useother=f
- B. | chart count over CurrentStanding by Action useother=f
- C. | chart count over CurrentStanding by Action limit-10
- D. | chart count over CurrentStanding by Action usenull-f useother-t

Answer: A,B

Explanation:
In Splunk, when using thechartcommand, theuseotherparameter can be set tofalse(f) to remove the 'OTHER' category, which is a bucket that Splunk uses to aggregate low-cardinality groups into a single group to simplify visualization. Here's how the options break down:
A:| chart count over CurrentStanding by Action useother=fThis command correctly sets theuseother parameter tofalse, which would prevent the 'OTHER' category from being displayed in the resulting visualization.
B:| chart count over CurrentStanding by Action usenull=f useother=tThis command hasuseotherset to true(t), which means the 'OTHER' category would still be included, so this is not a correct option.
C:| chart count over CurrentStanding by Action limit=10 useother=fSimilar to option A, this command also setsuseothertofalse, additionally imposing a limit to the top 10 results, which is a way to control the granularity of the chart but also to remove the 'OTHER' category.
D:| chart count over CurrentStanding by Action limit-10This command has a syntax error (limit-10should belimit=10) and does not include theuseother=fclause. Therefore, it would not remove the 'OTHER' category, making it incorrect.
The correct answers to rewrite the syntax to remove the 'OTHER' category are options A and C, which explicitly setuseother=f.

NEW QUESTION # 226

Two separate results tables are being combined using the |join command. The outer table has the following values:
Refer to following Tables

email	employeeNumber
jsmith@acme.com	1
mcarpenter@acme.com	2
jrogers@acme.com	3
bsparrow@acme.com	4
eripper@acme.com	5

The inner table has the following values:

employeeNumber	firstName	lastName
1	John	Smith
2	Mary	Carpenter
3	Jeff	Rogers

The line of SPL used to join the tables is: | join employeeNumber type=outer How many rows are returned in the new table?

- A. Three
- B. Five
- C. Eight
- D. Zero

Answer: C

Explanation:
When performing an outer join in Splunk using the | join employeeNumber type=outer command, it combines the rows from both tables based on the employeeNumber field. An outer join returns all rows from both tables, with matching rows from both sides where available. If there is no match, the result is NULL on the side of the join where there is no match.
In the provided tables, there are five rows in the first table and three in the second. Since it's an outer join, all rows from both tables will be returned. This means the new table will have a total of eight rows, combining the matched rows and the unmatched rows from both tables.

Splunk Documentation on the join command.
Splunk Community discussions on the usage of join and types of joins.

NEW QUESTION # 227
Which of the following search modes automatically returns all extracted fields in the fields sidebar?

- A. Smart
- B. Verbose
- C. Fast

Answer: B

Explanation:
The search modes determine how Splunk processes your search and displays your results2. There are three search modes: Fast, Smart and Verbose2. The search mode that automatically returns all extracted fields in the fields sidebar is Verbose2. The Verbose mode shows all the fields that are extracted from your events, including default fields, indexed fields and search-time extracted fields2. The fields sidebar is a panel that shows the fields that are present in your search results2.Therefore, option C is correct, while options A and B are incorrect because they are not search modes that automatically return all extracted fields in the fields sidebar.

NEW QUESTION # 228
Which of the following statements describes macros?

- A. A macro is a reusable search string that must contain only a portion of the search.
- B. A macro is a reusable search string that may have a flexible time range.
- C. A macro is a reusable search string that must have a fixed time range.
- D. A macro is a reusable search string that must contain the full search.

Answer: A
