HPE Storage Solutions Sample Questions (Q188-Q193):

NEW QUESTION # 188

A customer is implementing an SAP HANA environment and is looking for an alternative to an entirely in- memory database. Which storage technology should you recommend?

- A. NVMe SSD
- B. SAS SSD
- C. NVMe SCM
- D. Intel Optane

Answer: C

Explanation:

In an SAP HANA environment, the speed and latency of storage are critical for performance, especially when dealing with large datasets. While SAP HANA is designed to run entirely in memory, some customers may seek alternatives that offer a balance between performance and cost.

NVMe SCM (Storage Class Memory) is a cutting-edge storage technology that offers extremely low latency and high performance, making it an ideal alternative for environments like SAP HANA. NVMe SCM provides faster data access speeds than traditional SSDs and even NVMe SSDs, making it a perfect fit for workloads that demand high-speed data processing, such as SAP HANA.

NEW QUESTION # 189

Which functionality available in an HPE 3 Par StoreServ 8400 system that is not available in an HPE 3par Storesrve 7200

- A. Online import license
- B. Data at Rest Encryption
- **C. Persistent Checksum end-to-end data integrity (correct)**
- D. Adaptive optimization and dynamic Optimization

Answer: C

Explanation:

The HPE 3PAR StoreServ 8400 system includes the Persistent Checksum feature, which provides end-to-end data integrity. This functionality ensures that data remains consistent and uncorrupted as it travels through the system, from the host to the storage array and back. This feature is particularly important for environments where data integrity is critical, such as financial services or healthcare. The HPE 3PAR StoreServ 7200 does not offer this feature, making it a significant differentiator between the two systems.

NEW QUESTION # 190

You are planning a single-site Nimble solution with iSCSI connectivity. Two 10GbE SFP+ dual port NICs are included in the configuration. You designed an Intelligent Resilient Framework (IRF) stack with HPE FlexFabric 5900CP switches.

Which statement is correct when discussing the IRF limits for this configuration?

- A. When connecting an iSCSI storage to an IRF stack, a minimum of four 10GbE ports must be used per switch.
- B. The used IRF ports for iSCSI traffic have to be configured as 10GbE converged ports.
- C. In an IRF stack with storage connectivity, the 40GbE ports cannot be used.
- **D. A maximum of two switches can be used in an IRF stack when connecting storage.**

Answer: D

Explanation:

When designing an Intelligent Resilient Framework (IRF) stack for a Nimble storage solution using HPE FlexFabric 5900CP switches with iSCSI connectivity, the IRF stack typically supports up to two switches for optimal performance and redundancy. This limitation ensures that the iSCSI traffic is managed effectively without overcomplicating the network topology, which could potentially introduce latency or complexity in managing the stack.

Utilizing more than two switches in an IRF stack when connecting to storage could result in diminished returns in performance or increased management overhead, which is why HPE typically recommends limiting the IRF stack to two switches in such configurations.

NEW QUESTION # 191

Which storage sizing tool, designed for HPE 3PAR StoreServ, can be used to determine whether customers qualify for the Get Thin Guarantee Program?

- A. NinjaCrawler
- **B. NinjaProtected**
- C. NinjaStars
- D. StoreVista

Answer: B

NEW QUESTION # 192

A customer has a VMware environment running vSphere 6.5. They are running DL380 Gen10 servers with HPE 82Q adapters connected through a HPE SN3000B switch to a Nimble HF40. They plan to upgrade the hypervisor. What should they use to identify the latest firmware and compatibility information?

- A. SAN Health Diagnostics
- **B. SPOCK**
- C. OneView
- D. SAN Design Reference Guide

Answer: B

Explanation:

For identifying the latest firmware and compatibility information, especially in a VMware environment with HPE hardware, the SPOCK (Single Point of Connectivity Knowledge) tool (Option B) is the recommended resource. SPOCK provides detailed compatibility matrices, firmware recommendations, and interoperability guidelines, ensuring that all components in the storage and server environment are compatible and supported by HPE.

Using SPOCK ensures that the customer's upgrade process is smooth and that all hardware and software components are correctly aligned.
