Passing the Salesforce Development-Lifecycle-and-Deployment-Architect Exam is a significant achievement and can open up many new career opportunities in the Salesforce ecosystem.

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q217-Q222):

NEW QUESTION # 217

What sandbox type would be appropriate for diagnosing reports of poor performance when accessing certain Visualforce pages?

- A. Developer Sandbox.

- B. Partial copy Sandbox.
- **C. Full Sandbox**
- D. Developer Pro Sandbox.

Answer: C

NEW QUESTION # 218

Universal Containers is about to begin Development work on a new project in their Salesforce org that will take many months to complete. UC is concerned about how critical bugs will be addressed for existing live functionality. What is the recommended release management strategy to address this concern?

- A. Include fixes for critical bugs in the ongoing Development sandboxes so that they will be released with the other code.
- **B. Utilize a dedicated developer pro sandbox to address critical bugs and release to production.**
- C. Keep teams separate until the end of the project and create a Full Copy sandbox to merge their work then.
- D. Address critical bugs in the Development sandboxes and push those changes to production separately.

Answer: B

Explanation:

Explanation

Utilizing a dedicated developer pro sandbox to address critical bugs and release to production is the recommended release management strategy, as it allows the development team to work on the new project without being interrupted by the bug fixes, and also ensures that the bug fixes are deployed to production as soon as possible. Including fixes for critical bugs in the ongoing development sandboxes is not recommended, as it may delay the release of the bug fixes and also introduce conflicts with the new code. Keeping teams separate until the end of the project and creating a full copy sandbox to merge their work then is not recommended, as it may create a lot of merge conflicts and integration issues. Addressing critical bugs in the development sandboxes and pushing those changes to production separately is not recommended, as it may create inconsistencies between the development and production environments.

NEW QUESTION # 219

Universal Containers is reviewing its environment strategy. They have identified a need for a new hotfix environment to resolve any urgent production issues.

Which two sandbox types would be appropriate to use as the hotfix environment?

Choose 2 answers

- A. Full sandbox
- B. Partial Copy sandbox
- **C. Developer Pro sandbox**
- **D. Developer sandbox**

Answer: C,D

Explanation:

The two sandbox types that would be appropriate to use as the hotfix environment are Developer sandbox and Developer Pro sandbox. These sandbox types are suitable for testing and deploying quick fixes, as they are easy to create and refresh, and have a minimal data and metadata footprint. A Partial Copy sandbox or a Full sandbox would be too large and complex for a hotfix environment, and would take longer to create and refresh.

NEW QUESTION # 220

Universal Containers has a stable continuous integration process and all stakeholders are happy. However, user testing takes longtime, as data has to be setup. What should an Architect do to address this problem?

- A. Train business users to create test data more efficiently.
- B. Advise the project manager to assign more users to create test data.
- **C. Include automated sample data during deployment.**
- D. Test data creation is outside the scope of continuous integration.

Answer: C

Explanation:

The best solution to address the problem of user testing taking a long time due to data setup is to include automated sample data during deployment. This way, the users can have realistic and consistent data to test the functionality and performance of the system. Assigning more users to create test data, testing data creation being outside the scope of continuous integration, or training business users to create test data more efficiently are not effective solutions, as they still require manual effort and may result in inconsistent or inaccurate data.

NEW QUESTION # 221

A developer with Universal Containers recently created a flow in the developer sandbox. While working on the flow, the developer deactivated it and made updates multiple times before the flow worked as desired. Now the developer is planning to use a change set to migrate the flow to the QA sandbox.

What two statements should be considered when migrating the flow with change sets?

Choose 2 answers

- A. When a change set with a multiple versioned flow is uploaded, and no active version is available, it throws an exception.
- **B. When a change set with a multiple versioned flow is uploaded, it includes only the active version of the flow.**
- **C. When a change set with a multiple versioned flow is uploaded, and no active version is available, it includes the most recent inactive version of the flow.**
- D. When a change set with a multiple versioned flow is uploaded, it includes all the versions of the flow.

Answer: B,C

Explanation:

Explanation

When migrating a flow with change sets, the following statements should be considered: When a change set with a multiple versioned flow is uploaded, it includes only the active version of the flow. When a change set with a multiple versioned flow is uploaded, and no active version is available, it includes the most recent inactive version of the flow. These statements are based on the Salesforce documentation on how change sets handle flows with multiple versions. The other statements are incorrect, as they do not reflect the actual behavior of change sets.
