Cisco Designing and Implementing Secure Cloud Access for Users and Endpoints Sample Questions (Q108-Q113):

NEW QUESTION # 108
Using Duo for verifying user access to applications and data is effective because it:

- A. Ignores the principle of least privilege
- B. Encourages the use of weak passwords
- C. Provides multifactor authentication to ensure only authorized users gain access
- D. Decreases the security of user logins

Answer: C

NEW QUESTION # 109
Which common strategy should be used to mitigate directory traversal attacks in a cloud environment?

- A. Implement functionality validation.
- B. Use anti-cross-site request forgery tokens.
- C. Limit file system permissions.
- D. Apply the principle of least privilege.

Answer: C

Explanation:
Directory traversal attacks exploit improper file path validations to access unauthorized directories and files.
To prevent this, it is critical to restrict what areas of the file system an application or user can access. Limiting file system permissions prevents attackers from gaining access to sensitive areas even if a traversal vulnerability exists.
As explained in SCAZT Section 4 (Application and Data Security, Pages 85-87), enforcing minimal privileges and file system segmentation is a key defense against such attacks.
