## CompTIA Cloud Essentials+ Certification Exam Sample Questions (Q266-Q271):

### NEW QUESTION # 266

Which of the following security objectives is MOST improved when moving a system to the cloud?

- A. Confidentiality
- B. Integrity
- C. Availability
- D. Privacy

**Answer: C**

Explanation:

Availability is one of the security objectives that refers to the ability of authorized users to access and use the system and its resources when needed<sup>1</sup>. Availability is most improved when moving a system to the cloud, as cloud computing offers several benefits that enhance the reliability and accessibility of the system, such as<sup>23</sup>:

Scalability: Cloud computing allows the system to dynamically adjust the amount of resources allocated to meet the changing demand, without affecting the performance or availability of the system.

Redundancy: Cloud computing provides multiple copies of the system and its data across different locations and servers, ensuring that the system can continue to operate even if one or more components fail.

Backup and recovery: Cloud computing enables the system to regularly backup the data and configuration to the cloud, and restore them quickly in case of a disaster or a failure.

Maintenance and updates: Cloud computing allows the system to receive timely and automatic updates and patches from the cloud provider, without disrupting the availability of the system or requiring downtime.

Service level agreements: Cloud computing offers service level agreements (SLAs) that guarantee a certain level of availability and uptime for the system, and provide compensation or remediation in case of a breach. ### NEW QUESTION # 267

A company's current billing agreement is static. If the company were to migrate to an entirely IaaS-based setup, which of the following billing concepts would the company be adopting?

- A. Variable cost
- B. Enterprise agreement
- C. Perpetual
- D. Fixed cost

**Answer: A**

Explanation:

Variable cost is a billing concept that means the customer pays only for the resources they consume, and the cost varies depending on the usage. This is different from fixed cost, which means the customer pays a predetermined amount regardless of the usage.

IaaS-based setups typically use variable cost billing, as the customer can provision and deprovision resources on demand, and only pay for what they use. This allows the customer to optimize their costs and scale their resources according to their needs<sup>123</sup>.

### NEW QUESTION # 268

Which of the following would be expected from a security consultant who has been hired to investigate a data breach of a private cloud instance?

- A. Incident report
- B. Application scan results
- C. Request for information
- D. Risk register

**Answer: A**

Explanation:

An incident report is a document that summarizes the details of a security breach, such as the cause, impact, response, and lessons learned. It is expected from a security consultant who has been hired to investigate a data breach of a private cloud instance, as it provides a clear and concise account of what happened and how to prevent or mitigate future incidents. An incident report is also useful for communicating with stakeholders, regulators, customers, and other parties who may be affected by the breach.

Application scan results are the output of a tool that scans an application for vulnerabilities, such as SQL injection, cross-site scripting, or broken authentication. They are not expected from a security consultant who has been hired to investigate a data breach of a private cloud instance, as they are more relevant for the development and testing phases of the application lifecycle. Application scan results may help identify potential weaknesses in the application, but they do not provide a comprehensive analysis of the breach.

A request for information is a document that solicits information from vendors or service providers, such as their capabilities, pricing, or references. It is not expected from a security consultant who has been hired to investigate a data breach of a private cloud instance, as it is more relevant for the procurement and evaluation phases of the cloud service lifecycle. A request for information may help compare different cloud service options, but it does not provide a detailed report of the breach.

A risk register is a document that records the risks associated with a project or an organization, such as their likelihood, impact, mitigation strategies, and status. It is not expected from a security consultant who has been hired to investigate a data breach of a private cloud instance, as it is more relevant for the risk management and governance phases of the cloud service lifecycle. A risk register may help identify and prioritize the risks that need to be addressed, but it does not provide a specific report of the breach.

## NEW QUESTION # 269

Which of the following cloud computing services requires the MOST involvement from a company's in- house staff?

- A. PaaS
- B. IaaS
- C. SaaS
- D. MaaS

**Answer: B**

## NEW QUESTION # 270

Which of the following is a benefit of microservice applications in a cloud environment?

- A. The architecture of microservice applications allows the use of auto-scaling.
- B. Microservices are dependent on external shared databases found on cloud solutions.
- C. Federation is a mandatory component for an optimized microservice deployment.
- D. Microservice applications use orchestration solutions to update components in each service.

**Answer: A**

Explanation:

Microservice applications are composed of many smaller, loosely coupled, and independently deployable services, each with its own responsibility and technology stack<sup>1</sup>. One of the benefits of microservice applications in a cloud environment is that they can use auto-scaling, which is the ability to automatically adjust the amount of computing resources allocated to a service based on the current demand<sup>2</sup>. Auto-scaling can help improve the performance, availability, and cost-efficiency of microservice applications, as it allows each service to scale up or down according to its own needs, without affecting the rest of the application<sup>2</sup>. Auto-scaling can also help handle unpredictable or variable workloads, such as spikes in traffic or seasonal fluctuations<sup>2</sup>. Auto-scaling can be implemented using different cloud services, such as Google Kubernetes Engine (GKE) or Cloud Run, which provide both horizontal and vertical scaling options for microservice applications<sup>34</sup>.
