## Sample Questions (Q192-Q197):

### NEW QUESTION # 192

If a patient must do a 72-hour stool collection for fecal fat analysis, the stool should be kept under what conditions during the collection period?

- A. Frozen in separate bags for each day
- B. In a heated container
- C. At room temperature
- D. Under refrigeration

**Answer: D**

Explanation:

If a patient must do a 72-hour stool collection for fecal fat analysis, the stool should be kept under refrigeration during the collection period. The patient is provided a large gallon container with a lid and written and verbal instructions. The patient should be cautioned to avoid contaminating the stool specimen with urine, which may alter the test results. One method of collecting the stool is to place plastic wrap securely over the back half of the toilet bowl. Special collection devices are also available.

### NEW QUESTION # 193

Which of the following is an appropriate question to verify a patient's ID?

- A. "Are you Ms. Evans? What is your birthdate?"
- B. "Can you tell me your name and birthdate?"
- C. "Ms. Evans, were you born on March 16, 1980?"
- D. "Is your name Sally Evans?"

**Answer: B**

Explanation:

An appropriate question to verify a patient's ID is "Can you tell me your name and birthdate?" Asking for direct information is important because if a patient is confused or hard of hearing, he or she may answer "yes" or "no" to questions incorrectly. For inpatients, the ID band should always be checked to verify the information that they provide. If patients do not have an ID band, which is common in the outpatient setting, they should be asked to provide and spell their names and provide their birthdates.

### NEW QUESTION # 194

The left atrioventricular valve of the heart is called the:

- A. Pulmonic valve
- B. Mitral valve
- C. Aortic valve
- D. Tricuspid valve

**Answer: B**

Explanation:

The left atrioventricular valve of the heart is called the mitral valve. After the blood flows into the right atrium, it flows through the tricuspid valve to the right ventricle; from there it travels through the pulmonic valve to the pulmonary arteries and to the lungs for oxygenation. The blood returns through the pulmonic veins into the left atrium and then through the mitral valve to the left ventricle and out the aortic valve to the general circulation via the aorta.

### NEW QUESTION # 195

Specimen containers should be properly labeled:

- A. Immediately after the specimens are obtained
- B. Either before or after the specimens are obtained based on expediency

- C. Immediately before the specimens are obtained
- D. After the patient leaves of life.

**Answer: A**

Explanation:

Specimen containers should be properly labeled immediately after the specimens are obtained and while the patient is still present and can observe that the labeling is taking place. The label must contain the patient's first and last names, the patient ID or record number, the date and time of collection, and the name or other identifying information of the person who collected the specimen. If the patient has an ID band, the phlebotomist must compare the information on the label to the information on the band.

#### **NEW QUESTION # 196**

If a patient sitting in a chair has a generalized convulsive seizure during venipuncture, the appropriate response is to discontinue venipuncture and:

- A. Support the patient in the chair and call 9-1-1.
- B. Place a tongue blade between the patient's teeth.
- **C. Call for help to ease the patient to the floor.**
- D. Restrain the patient in the chair.

**Answer: C**

Explanation:

If a patient sitting in a chair has a generalized convulsive seizure during venipuncture, the appropriate response is to discontinue venipuncture and call for help to ease the patient to the floor in order to avoid patient injury. The patient should be placed on one side if possible, but movements should not be restrained, and nothing should be placed in the patient's mouth. If possible, a pillow or blanket should be placed under the patient's head and restrictive clothing should be loosened. The time that the seizure begins and ends should be noted and first-aid personnel should be notified.

#### **NEW QUESTION # 197**

.....

The quality of our PTC-AMCA exam questions is very high and we can guarantee to you that you will have no difficulty to pass the exam. The content of the questions and answers of PTC-AMCA study braindumps is refined and focuses on the most important information.
