### WGU Managing Cloud Security (JY02) Sample Questions (Q186-Q191):

#### NEW QUESTION # 186

Which process is implemented during the hardening of an operating system (OS) and its workloads?

- A. Security management
- B. Change management
- C. Incident management
- **D. Patch management**

Answer: D

Explanation:

Patch management is a core process implemented during the hardening of an operating system and its workloads. Managing Cloud principles explain that OS hardening involves reducing vulnerabilities by applying security patches, updates, and fixes to eliminate known weaknesses.

Patch management ensures that operating systems, applications, and dependencies are kept up to date with vendor-released security patches. This process reduces the attack surface and prevents exploitation of known vulnerabilities. Effective patch management includes testing, deployment, verification, and ongoing monitoring.

Change management governs how changes are approved, incident management handles security events, and security management is a broader governance function. Therefore, patch management is the correct process associated with OS hardening.

#### NEW QUESTION # 187

Which privacy issue does the Clarifying Lawful Overseas Use of Data (CLOUD) Act address?

- A. Collection and use of genetic information
- B. Data breach notification requirements
- C. Use of digital surveillance by multinational employers
- **D. Conflicting regulations in different jurisdictions**

**Answer: D**

Explanation:

The CLOUD Act addresses conflicts that arise when law enforcement in one jurisdiction seeks access to data stored in another country. It clarifies how U.S. authorities can compel cloud providers to produce data, even if stored overseas, and establishes a framework for resolving jurisdictional conflicts through bilateral agreements.

The Act does not regulate genetic data, breach notifications, or employer surveillance. Its central purpose is to handle the challenge of cross-border data access in the era of globalized cloud computing.

For organizations, this means carefully evaluating how and where data is stored, and ensuring contracts and compliance strategies account for potential conflicts between U.S. law and foreign privacy regulations like GDPR. Awareness of CLOUD Act obligations is crucial in multinational cloud deployments.

#### NEW QUESTION # 188

Which cloud infrastructure risk is the responsibility of the cloud provider?

- **A. Physical security**
- B. Data security
- C. Application security
- D. Security governance

**Answer: A**

Explanation:

Physical security is a cloud infrastructure risk that is the responsibility of the cloud provider. Managing Cloud principles explain that providers are responsible for securing data center facilities, including buildings, hardware, power systems, and environmental controls.

This includes access controls, surveillance, guards, and protection against physical threats such as theft, vandalism, and natural disasters. Customers do not have physical access to cloud data centers and therefore rely entirely on the provider to manage these risks.

Data security and application security are typically shared responsibilities, while security governance is largely the customer's responsibility. Therefore, physical security is the correct answer.

#### NEW QUESTION # 189

Which design component contains both a remotely accessible application programming interface (API) and a web graphical user interface?

- A. Metastructure
- **B. Management**
- C. Applistructure

- D. Infrastructure

**Answer: B**

Explanation:

The Management component contains both a remotely accessible application programming interface (API) and a web-based graphical user interface. Managing Cloud documentation explains that the management layer is responsible for provisioning, monitoring, configuration, and administration of cloud resources.

This component enables administrators and automation tools to interact with cloud services programmatically through APIs, while also providing human-accessible web consoles for operational management. The dual- interface design supports scalability, automation, and ease of use.

Infrastructure provides raw compute, storage, and networking. Applistructure refers to deployed applications and services, while metastructure supports orchestration and abstraction. Therefore, the management component is the correct answer.

### NEW QUESTION # 190

An organization needs to provide space where security administrators can centrally monitor network traffic and events and respond to threats or outages. What should the organization create?

- A. Security operations center (SOC)
- B. Emergency response team (ERT)
- C. Disaster response team (DRT)
- D. Network operations center (NOC)

**Answer: A**

Explanation:

A Security Operations Center (SOC) is a centralized facility that allows administrators to monitor, detect, investigate, and respond to cybersecurity events in real time. SOC teams leverage tools such as SIEM (Security Information and Event Management), threat intelligence, and incident response playbooks.

ERTs and DRTs are teams focused on emergencies and disaster recovery, respectively, but they do not provide continuous monitoring. A NOC focuses on performance and availability of IT infrastructure but not on security threats.

By establishing a SOC, organizations ensure 24/7 visibility into security events, coordinated incident handling, and compliance with standards such as ISO 27001 and SOC 2. SOCs are essential in cloud environments where threats evolve rapidly, and centralized expertise is needed to minimize impact.
