WGU Cloud Deployment and Operations Sample Questions (Q40-Q45):

NEW QUESTION # 40

(Which type of support plan provides a technical account manager and full use of Trusted Advisor?)

- A. Business
- B. Standard
- C. Enterprise
- D. Developer

Answer: C

Explanation:

The Enterprise support plan provides a technical account manager (TAM) and full use of Trusted Advisor, offering proactive guidance and comprehensive access to all checks. This plan is designed for large-scale, mission-critical workloads. The WGU Cloud Deployment and Operations Study Guide (Section 6.4, AWS Support Plans) states, "The Enterprise support plan includes a dedicated Technical Account Manager and full Trusted Advisor access, providing 24/7 support and proactive optimization

recommendations." Developer, Standard, and Business plans offer limited or no TAM support and partial Trusted Advisor access.

NEW QUESTION # 41

(What needs to be configured in Systems Manager to run Automation documents on schedule?)

- A. Rate control
- **B. Maintenance window**
- C. Resource groups
- D. Session preferences

Answer: B

Explanation:

To run Automation documents on a schedule in AWS Systems Manager, a maintenance window must be configured. Maintenance windows define the time periods during which automated tasks, including the execution of Automation documents, can run. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Maintenance Windows) explains that maintenance windows are used to schedule and control the execution of Systems Manager tasks, ensuring they align with operational windows. Rate control, session preferences, and resource groups are not used for scheduling automation tasks.

NEW QUESTION # 42

(A company uses KMS for key management. The company has a requirement to ensure that cryptographic material is not used longer than a year. Which solution should be used to meet this requirement with the least amount of effort?)

- A. Develop a custom key encryption protocol for KMS
- B. Write a Lambda function to replace keys in KMS
- **C. Enable automatic key rotation in KMS**
- D. Move keys from KMS to CloudHSM

Answer: C

Explanation:

Enabling automatic key rotation in AWS Key Management Service (KMS) is the least effort solution to ensure cryptographic material is not used longer than a year. KMS automatically rotates the cryptographic material of symmetric customer master keys (CMKs) every 365 days, meeting the requirement without manual intervention. The WGU Cloud Deployment and Operations Study Guide (Section 6.3, KMS) states,

"Automatic key rotation in KMS rotates the backing key material every year for symmetric CMKs, providing a low-effort way to comply with key usage limits." Moving to CloudHSM, custom protocols, or Lambda functions require more effort and complexity.

NEW QUESTION # 43

(Where does Patch Manager send compliance reports?)

- A. Route 53
- B. Elastic Block Store (EBS)
- **C. Simple Storage Service (S3)**
- D. OpsWorks

Answer: C

Explanation:

Patch Manager in AWS Systems Manager sends compliance reports to an Amazon S3 bucket, where they are stored for auditing and analysis. This allows administrators to track patch compliance status across EC2 instances and on-premises servers. The WGU Cloud Deployment and Operations Study Guide (Section 5.2, Patch Manager) states, "Patch Manager compliance reports are delivered to an S3 bucket configured as a target, providing a centralized location for reviewing patch status and compliance data." OpsWorks, EBS, and Route 53 are not used for storing these reports.

NEW QUESTION # 44

(Which two solutions are supported by CloudWatch? Choose 2 answers.)

- A. Load balancing
- B. Event response
- C. Threat detection
- D. Instance monitoring

Answer: B,D

Explanation:

Amazon CloudWatch supports several monitoring and management solutions, including event response and instance monitoring. Event response is facilitated through CloudWatch Events, which can trigger actions based on predefined rules, such as invoking AWS Lambda functions. Instance monitoring involves collecting and tracking metrics from Amazon EC2 instances, providing visibility into performance and health. The WGU Cloud Deployment and Operations Study Guide (Section 4.1, CloudWatch Overview) highlights that CloudWatch is designed for instance monitoring and event-driven responses, while load balancing and threat detection are handled by services like Elastic Load Balancing and GuardDuty, respectively.
