HPE7-A01 Practice Online - HPE7-A01 Vce Torrent

With great outcomes of the passing rate upon to 98-100 percent, our HPE7-A01 practice engine is totally the perfect ones. We never boost our achievements on our HPE7-A01 exam questions, and all we have been doing is trying to become more effective and perfect as your first choice, and determine to help you pass the HPE7-A01 Study Materials as efficient as possible. Just to try on our HPE7-A01 training guide, and you will love it.

HP Aruba Certified Campus Access Professional Exam Sample Questions (Q141-Q146):

NEW QUESTION # 141

What is one advantage of using OCSP vs CRLs for certificate validation?

- A. supports longer certificate validity periods
- B. higher availability for certificate validation
- C. less complex to implement
- D. reduces latency between the time a certificate is revoked and validation reflects this status

Answer: D

Explanation:

OCSP is a protocol that allows clients to query the CA or a trusted responder for the status of a specific certificate. OCSP requests and responses are smaller and faster than CRLs, and they can provide real-time information about the revocation status of a certificate¹². CRLs are lists of all revoked certificates that are downloaded from the CA. CRLs can present issues, as they can become outdated and have to be downloaded frequently¹³. Therefore, OCSP reduces latency between the time a certificate is

revoked and validation reflects this status. References: 1 <https://sectigostore.com/blog/ocsp-vs-crl-whats-the-difference/> 2 <https://www.keyfactor.com/blog/what-is-a-certificate-revocation-list-crl-vs-ocsp/> 3 <https://www.fortinet.com/resources/cyberglossary/ocsp>

NEW QUESTION # 142

Refer to the exhibit. A company has deployed 200 AP-635 access points. To but is not working as expected. What would be the correct action to fix the issue?

- A. Change the SSID to WPA3-Enterpnse (CNSA).
- B. Change the SSID to WPA3-Personal
- C. Change the SSID to WPA3-Enterprise (CCM).
- **D. Change the SSID to WPA3-Enhanced Open**

Answer: D

Explanation:

This is the correct action to fix the issue where the SSID is not working as expected. WPA3- Enhanced Open is a new security standard for public networks that uses Opportunistic Wireless Encryption (OWE) to provide encryption and privacy on open, non-password-protected networks.

WPA3-Enhanced Open can be configured on an Aruba Access Point by changing the SSID security mode to WPA3-Enhanced Open in Aruba Central or Aruba Instant. The other options are incorrect because they either do not use WPA3-Enhanced Open or do not exist as valid security modes.

NEW QUESTION # 143

A customer has a site with 200 AP-515 access points 75AP-565 access points installed. The customer is rolling out new mobile phones with Wi-Fi-calling. 802.1X is in use for authentication What should be enabled to ensure the best roaming experience?

- A. 802 .11h
- **B. 802.1X**
- C. 802.11W
- D. 802. 11r

Answer: B

Explanation:

Explanation

<https://www.howtogeek.com/794724/what-is-wi-fi-calling/> 2:

<https://www.networkcomputing.com/networking/your-network-optimized-wifi-calling> 3:

https://www.arubanetworks.com/techdocs/AOS-CX/10.10/HTML/monitoring_6300-6400/Content/Chp_LEDs/fr Wi-Fi calling is a feature that allows you to make or receive voice calls over Wi-Fi instead of cellular network.

Wi-Fi calling can provide better voice quality and reliability in areas with poor or no cellular coverage.

NEW QUESTION # 144

You need to drop excessive broadcast traffic on an ingress port or an ArubaOS-CX switch. What is the best feature to use for this task?

- A. QoS shaping
- B. Strict queuing
- C. DWRR queuing
- **D. Rate limiting**

Answer: D

Explanation:

According to the Aruba Documentation Portal¹, the ArubaOS-CX switch supports various features to control the ingress traffic on specific ports, such as rate limiting, QoS shaping, and access control. These features can help reduce the impact of excessive broadcast traffic on the network performance and availability.

This is because rate limiting is a feature that allows you to limit the inbound or outbound traffic on a port based on a percentage of

the port capacity or a fixed amount of bytes per second. Rate limiting can help prevent broadcast storms by reducing the amount of broadcast packets that enter or leave a port.

NEW QUESTION # 145

A system engineer needs to preconfigure several Aruba CX 6300 switches that will be sent to a remote office. An untrained local field technician will do the rollout of the switches and the mounting of several AP-515s and AP-575S. Cables running to the APs are not labeled.

The VLANs are already preconfigured to VLAN 100 (mgmt), VLAN 200 (clients), and VLAN 300 (guests).

What is the correct configuration to ensure that APs will work properly?

- A. ☐
- B. ☐
- C. ☐

Answer: A

Explanation:

Option C is the correct configuration to ensure that APs will work properly. It uses the ap command to configure a port profile for APs with VLAN 100 as the native VLAN and VLAN 200 and 300 as tagged VLANs. It also enables LLDP on the ports to discover the APs and assign them to the port profile automatically. The other options are incorrect because they either do not use the ap command, do not enable LLDP, or do not configure the VLANs correctly.
