Salesforce Platform-App-Builder Certification Exam is one of the most sought-after certifications in the Salesforce ecosystem. It is designed for professionals who want to demonstrate their expertise in building custom applications on the Salesforce platform. Salesforce Certified Platform App Builder certification validates a candidate's knowledge and skills in designing, building, and implementing custom applications using the declarative features of the Salesforce platform.

Salesforce Certified Platform App Builder Sample Questions (Q207-Q212):

NEW QUESTION # 207

A sales manager at Cloud Kicks wants the team to spend more time in the field and less time manually entering the information found on the business cards they collect.

What should an app builder do to help achieve this goal without sacrificing data quality?

- A. Use Flow to create a data entry wizard to automate data entry.
- B. Use a combination of workflow rules and formula fields to populate key fields for the sales user.
- C. Post daily to the Chatter feed any relevant fields that need to be populated.
- **D. Research and evaluate data enrichment products on the AppExchange to automate data entry.**

Answer: D

Explanation:

The best way to help the sales manager achieve their goal of reducing manual data entry from business cards is to research and evaluate data enrichment products on the AppExchange that can automate data entry. Data enrichment products can scan business cards, extract relevant information, and populate fields in Salesforce records. This can save time, improve data quality, and enhance productivity. Option B, C, and D are not effective solutions for this goal.

NEW QUESTION # 208

Universal Containers uses a custom object called Reviews to capture information generated by interviewers during the candidate process. The Review records are visible to any user that has access to the related custom Candidate record. The VP of Human Resources wants the comment field on the Review to be private to anyone outside of the HR department. How should the app builder meet this requirement?

- A. Create a sharing rule to share the field with the VP of HR with Role and Subordinates.
- B. Create a page layout with the field for HR users and another page layout without the field for all other users.
- **C. Create a page layout with the field and use field-level security to hide the field from all other users.**
- D. Create an Apex sharing rule to share the field with users that have "HR" in their role.

Answer: C

NEW QUESTION # 209

A new field has been added to the Applicant object that is part of an unmanaged package. A recruiter ran the Position with or without Applicants report and noticed that the new field was missing as an option to add as a column.

How should an app builder troubleshoot this issue?

- A. Update the profile with the Manage Public Reports permission.
- B. Adjust the field level security to include in the report type.
- **C. Add the field to the custom report type field layout.**
- D. Check Allow Reports for the position and applicant objects.

Answer: C

Explanation:

Explanation

The app builder should add the field to the custom report type field layout to troubleshoot this issue. A custom report type is a type of report that defines which objects and fields are available for reporting. The app builder can customize which fields are included in each custom report type by editing its field layout. If a new field is added to an object that is part of an unmanaged package, it will not be automatically added to the custom report type field layout. The app builder needs to manually add it to make it available as an option to add as a column in reports based on that custom report type. Option A, B, and D are not steps that can troubleshoot this issue.

NEW QUESTION # 210

What is a key consideration when using unmanaged packages? Choose 2 answers

- A. The person who created the unmanaged package can change or update installed components
- **B. The person who created the unmanaged package has no control over the installed components**
- **C. A namespace is not required to create an unmanaged package.**
- D. A namespace is required to create an unmanaged package.

Answer: B,C

Explanation:

Explanation - Namespaces are not used in unmanaged packages. In fact, even if your organization is namespace, the namespace is removed from all components when it is uploaded as an unmanaged package.

https://developer.salesforce.com/page/An_Introduction_to_Packaging

Once the components are installed from an unmanaged package, the components can be edited in the organization they are installed in. The developer who created and uploaded the unmanaged package has no control over the installed components, and can't change or upgrade them. https://help.salesforce.com/apex/HTViewHelpDoc?id=sharing_apps.htm

NEW QUESTION # 211

Universal Containers is adding drone delivery to service offerings, and the developer has written and tested code prior to deployment to production, and the change set is ready to go. The deployment window will occur when the developer is on vacation. What can the app builder do to ensure a smooth deployment to production?

- A. Remove Apex classes from ABOUND change set.
- B. Validate the outbound change set.
- C. Use a metadata package set.
- **D. Validate the inbound change set.**

Answer: D

Explanation:

The app builder should validate the inbound change set to ensure a smooth deployment to production.

Validating an inbound change set allows the app builder to test whether the change set can be deployed without errors in the target org. Validating an inbound change set does not affect any data or metadata in the target org.

NEW QUESTION # 212

.....

Our company is a professional certificate exam materials provider.
