CompTIA SecurityX Certification Exam Sample Questions (Q261-Q266):

NEW QUESTION # 261
A company's SICM Is continuously reporting false positives and false negatives The security operations team has Implemented configuration changes to troubleshoot possible reporting errors Which of the following sources of information best supports the required analysts process? (Select two).

- A. Third-party reports and logs
- B. Manual review processes
- C. Alert failures
- D. Dashboards
- E. Trends
- F. Network traffic summaries

Answer: A,E

Explanation:
When dealing with false positives and false negatives reported by a Security Information and Event Management (SIEM) system, the goal is to enhance the accuracy of the alerts and ensure that actual threats are identified correctly. The following sources of information best support the analysis process:
A: Third-party reports and logs: Utilizing external sources of information such as threat intelligence reports, vendor logs, and other third-party data can provide a broader perspective on potential threats. These sources often contain valuable insights and context that can help correlate events more accurately, reducing the likelihood of false positives and false negatives.
B: Trends: Analyzing trends over time can help in understanding patterns and anomalies in the data. By observing trends, the security team can distinguish between normal and abnormal behavior, which aids in fine- tuning the SIEM configurations to better detect true positives and reduce false alerts.
Other options such as dashboards, alert failures, network traffic summaries, and manual review processes are also useful but are more operational rather than foundational for understanding the root causes of reporting errors in SIEM configurations.

NEW QUESTION # 262
A security analyst needs to ensure email domains that send phishing attempts without previous communications are not delivered to mailboxes The following email headers are being reviewed
Which of the following is the best action for the security analyst to take?

- A. Reroute all messages with unusual security warning notices to the IT administrator
- B. Block vendor com for repeated attempts to send suspicious messages
- C. Quarantine all messages with sales-mail.com in the email header
- D. Block messages from hr-saas.com because it is not a recognized domain.

Answer: B

Explanation:
In reviewing email headers and determining actions to mitigate phishing attempts, the security analyst should focus on patterns of suspicious behavior and the reputation of the sending domains. Here's the analysis of the options provided:
A: Block messages from hr-saas.com because it is not a recognized domain: Blocking a domain solely because it is not recognized can lead to legitimate emails being missed. Recognition alone should not be the criterion for blocking.
B: Reroute all messages with unusual security warning notices to the IT administrator: While rerouting suspicious messages can be a good practice, it is not specific to the domain sending repeated suspicious messages.
C: Quarantine all messages with sales-mail.com in the email header: Quarantining messages based on the presence of a specific domain in the email header can be too broad and may capture legitimate emails.
D: Block vendor com for repeated attempts to send suspicious messages: This option is the most appropriate because it targets a domain that has shown a pattern of sending suspicious messages. Blocking a domain that repeatedly sends phishing attempts without previous communications helps in preventing future attempts from the same source and aligns with the goal of mitigating phishing risks.
References:
* CompTIA SecurityX Study Guide: Details best practices for handling phishing attempts, including blocking domains with repeated suspicious activity.
* NIST Special Publication 800-45 Version 2, "Guidelines on Electronic Mail Security": Provides guidelines on email security, including the management of suspicious email domains.
* "Phishing and Countermeasures: Understanding the Increasing Problem of Electronic Identity Theft" by Markus Jakobsson and Steven Myers: Discusses effective measures to counter phishing attempts, including blocking persistent offenders.
By blocking the domain that has consistently attempted to send suspicious messages, the security analyst can effectively reduce the risk of phishing attacks.

NEW QUESTION # 263
A company is migrating from a Windows Server to Linux-based servers. A security engineer must deploy a configuration management solution that maintains security software across all the Linux servers. Which of the following configuration file snippets is the most appropriate to use?

- A. { " name " : " deployment " , " hosts " : " linux_servers " , " remote_user " : " Administrator " , " tasks " : { " name " : " Install security software " , " com.microsoft.store.latest " } }
- B. < hosts > linux_servers < /hosts > < os_type > Linux 3.1 < /os_type > < SElinux > true < /SElinux > < source > com.canonical.io < /source >
- C. { " task " : " install " , " hosts " : " linux_servers " , " remote_user " : " root " , " se_linux " : " false " , " application " : " AppX " }
- D. --- - name: deployment hosts: linux_servers remote_user: root tasks: - name: Install security software ansible.builtin.apt:

Answer: D

Explanation:
The correct snippet is Option A, which shows an Ansible YAML playbook designed to deploy and maintain security software on Linux servers. Ansible is a configuration management tool widely used in enterprise environments, and the ansible.builtin.apt module specifically manages package installation on Debian/Ubuntu- based Linux distributions. This ensures consistent security software deployment across multiple servers.
Option B is XML-based and does not represent a valid configuration management script. Option C incorrectly uses JSON format and references Microsoft's store (com.microsoft.store.latest), which is irrelevant for Linux.
Option D also uses JSON syntax with "AppX," which applies to Windows applications, not Linux.
CAS-005 emphasizes infrastructure as code (IaC) and automation as best practices for secure system configuration. YAML-based playbooks in Ansible provide repeatability, auditability, and scalability, making Option A the most secure and appropriate solution.

NEW QUESTION # 264
An organization wants to implement a platform to better identify which specific assets are affected by a given vulnerability. Which of the following components provides the best foundation to achieve this goal?

- A. SLM
- B. SBoM
- C. SASE
- D. CMDB

Answer: D

Explanation:
A Configuration Management Database (CMDB) provides the best foundation for identifying which specific assets are affected by a given vulnerability. A CMDB maintains detailed information about the IT environment, including hardware, software, configurations, and relationships between assets. This comprehensive view allows organizations to quickly identify and address vulnerabilities affecting specific assets.
References:
* CompTIA SecurityX Study Guide: Discusses the role of CMDBs in asset management and vulnerability identification.
* ITIL (Information Technology Infrastructure Library) Framework: Recommends the use of CMDBs for effective configuration and asset management.
* "Configuration Management Best Practices" by Bob Aiello and Leslie Sachs: Covers the importance of CMDBs in managing IT assets and addressing vulnerabilities.
