Cisco Conducting Forensic Analysis & Incident Response Using Cisco Technologies for CyberOps Sample Questions (Q23-Q28):

NEW QUESTION # 23

Refer to the exhibit.

What is occurring within the exhibit?

- A. Source 10.1.21.101 sends HTTP requests with the size of 302 kb.
- B. Host 209.141.51.196 redirects the client request to port 49723.
- C. Source 10.1.21.101 is communicating with 209.141.51.196 over an encrypted channel.
- **D. Host 209.141.51.196 redirects the client request from /Lk9tdZ to /files/1.bin.**

Answer: D

Explanation:

The Wireshark capture shows a series of HTTP requests and responses:

* The client (10.1.21.101) sends a GET request for /Lk9tdZ.

* The server (209.141.51.196) responds with HTTP/1.1 302 Found, which is a standard HTTP status code indicating a redirection.

* The subsequent GET request from the client is for /files/1.bin, which indicates it followed the redirect.

This behavior confirms that the server is issuing an HTTP 302 redirect from the initial request path /Lk9tdZ to /files/1.bin. This is often observed in malware command-and-control behavior or file download staging.

* Option A is incorrect: 302 is a status code, not a data size.

* Option C is incorrect: port 49723 is a source/destination ephemeral port, not a redirect target.

* Option D is incorrect: communication is over HTTP, not HTTPS (which would indicate encryption).

NEW QUESTION # 24

What is the steganography anti-forensics technique?

- A. hiding a section of a malicious file in unused areas of a file
- B. sending malicious files over a public network by encapsulation
- **C. concealing malicious files in ordinary or unsuspecting places**
- D. changing the file header of a malicious file to another file type

Answer: C

```

- A. ascii85
- B. hexadecimal
- C. Base64
- D. JavaScript

Answer: C

Explanation:

The string in the exhibit is a classic example of Base64 encoding. Base64 is used to encode binary data into ASCII characters, making it suitable for transmitting data over media that are designed to deal with textual data. It typically ends with one or two equal signs (=padding), which this string does. This format is commonly seen in obfuscated payloads or malware communications in the wild.

NEW QUESTION # 27

An "unknown error code" is appearing on an ESXi host during authentication. An engineer checks the authentication logs but is unable to identify the issue. Analysis of the vCenter agent logs shows no connectivity errors. What is the next log file the engineer should check to continue troubleshooting this error?

- A. /var/log/shell.log
- B. /var/log/syslog.log
- C. /var/log/vmksummary.log
- D. /var/log/general/log

Answer: C

Explanation:

In VMware ESXi systems, the vmksummary.log file is responsible for capturing general system events, including uptime, reboot statistics, and key service-related issues. It serves as a valuable source for troubleshooting persistent or unexplained system behaviors.

The Cisco CyberOps study guide references log file paths used in system diagnostics and incident response, and for authentication-related issues on ESXi where standard logs don't yield insights, vmksummary.log is the recommended next source for identifying systemic service faults or anomalies.
