Newest Snowflake COF-C02 Practice Questions in PDF Format for Quick Preparation

As a responsible company with great reputation among the market, we trained our staff and employees with strict beliefs to help you with any problems about our COF-C02 Learning materials 24/7. Even you have finished buying activity with us, we still be around you with considerate services on the COF-C02 Exam Questions. And we will update our COF-C02 training guide from time to time, once we update our COF-C02 study guide, we will auto send it to our customers. And you can enjoy our updates of COF-C02 learning prep for one year after your payment.

Snowflake SnowPro Core Certification Exam Sample Questions (Q918-Q923):

NEW QUESTION # 918
Which Snowflake table is an implicit object layered on a stage, where the stage can be either internal or external?

- A. Temporary table

- B. A table with a materialized view
- C. Transient table
- D. Directory table

Answer: D

Explanation:
A directory table in Snowflake is an implicit object layered on a stage, whether internal or external. It allows users to query the contents of a stage as if it were a table, providing metadata about the files stored in the stage, such as filenames, file sizes, and last modified timestamps.

Snowflake Documentation: Directory Tables

NEW QUESTION # 919
In Snowflake, what allows users to perform recursive queries?

- A. PIVOT
- B. CONNECT BY
- C. LATERAL
- D. QUALIFY

Answer: B

Explanation:
In Snowflake, the CONNECT BY clause allows users to perform recursive queries. Recursive queries are used to process hierarchical or tree-structured data, such as organizational charts or file systems. The CONNECT BY clause is used in conjunction with the START WITH clause to specify the starting point of the hierarchy and the relationship between parent and child rows.

Snowflake Documentation: Hierarchical Queries

NEW QUESTION # 920
What happens when a cloned table is replicated to a secondary database? (Select TWO)

- A. The physical data is replicated
- B. Metadata pointers to cloned tables are replicated
- C. The replication will not be successful.
- D. Additional costs for storage are charged to a secondary account
- E. A read-only copy of the cloned tables is stored.

Answer: A,B

Explanation:
When a cloned table is replicated to a secondary database in Snowflake, the following occurs:
C . The physical data is replicated: The actual data of the cloned table is physically replicated to the secondary database. This ensures that the secondary database has its own copy of the data, which can be used for read-only purposes or failover scenarios1.
E . Metadata pointers to cloned tables are replicated: Along with the physical data, the metadata pointers that refer to the cloned tables are also replicated. This metadata includes information about the structure of the table and any associated properties2.
It's important to note that while the physical data and metadata are replicated, the secondary database is typically read-only and cannot be used for write operations. Additionally, while there may be additional storage costs associated with the secondary account, this is not a direct result of the replication process but rather a consequence of storing additional data.

NEW QUESTION # 921
Which command is used to unload data from a Snowflake table into a file in a stage?

- A. GET

- B. WRITE
- C. COPY INTO
- D. EXTRACT INTO

Answer: C

NEW QUESTION # 922
A single user of a virtual warehouse has set the warehouse to auto-resume and auto-suspend after 10 minutes. The warehouse is currently suspended and the user performs the following actions:
1. Runs a query that takes 3 minutes to complete
2. Leaves for 15 minutes
3. Returns and runs a query that takes 10 seconds to complete
4. Manually suspends the warehouse as soon as the last query was completed When the user returns, how much billable compute time will have been consumed?

- A. 14 minutes
- B. 24 minutes
- C. 4 minutes
- D. 10 minutes

Answer: A

Explanation:
The billable compute time includes the time the warehouse is running queries plus the auto-suspend time after the last query if the warehouse is not manually suspended. In this scenario, the warehouse runs for 3 minutes, suspends after 10 minutes of inactivity, resumes for a 10-second query, and then is manually suspended. The total billable time is the sum of the initial 3 minutes, the 10 minutes of auto-suspend time, and the brief period for the 10-second query, which is rounded up to the next full minute due to Snowflake's billing practices.
