**NEW QUESTION # 44**

A storage administrator wants to migrate from a single-node Dell Avamar server to a Avamar multi-node server. Which method of replication should be used?

- A. Root-to-root
- B. Normal
- C. Root-to-replicate
- D. Selective

**Answer: A**

Explanation:

Explanation/Reference:

It is possible to configure four different replication configurations with the replication plug-in. In pre-Avamar 7.0, Many-to-One, Cross, and Root-to-root replication could be configured. In Avamar 7.0, using the replication plug-in, Many-to-One, One-to-Many, Chain, and Cross replication can be configured. However, as stated earlier, Root-to-root replication must be performed using the Cron-based replication. The replication plug-in cannot perform Root-to-root-based replication.

**Best practices for replication**

- ◆ Protect the data on the Avamar server by replicating the data to another Avamar server.
- ◆ Use default standard replication, also known as “root-to-REPLICATE” replication, to do the following:
  - Provide the flexibility to configure replicated Avamar servers in a wide variety of ways
  - Have full visibility into all the backups that you replicate from one Avamar server to another

Standard replication also supports the ability to replicate the contents of many replication source Avamar servers to a single large replication destination (many-to-one), or to cross-replicate the contents of a couple of Avamar servers to each other. At any time, you can browse the contents of the /REPLICATE domain on the replication destination and see all the backups that have been replicated for each account.
