GitHub Actions training torrent & GH-200 updated dumps & GitHub Actions latest material

The web-based GitHub Actions (GH-200) practice exam can be accessed through online browsing anywhere just with a stable internet connection. So the applicants can take the GH-200 practice exam with ease for the preparation for the GH-200 Exam. All browsers and operating systems support the web-based GH-200 practice exam. Users can access it without installing or downloading any excessive plugins or software.

Microsoft GitHub Actions Sample Questions (Q12-Q17):

NEW QUESTION # 12

As a developer, you need to add the correct syntax to allow the following workflow file to be triggered by multiple types of events. Which two code blocks should you add starting at line 5?

(Each correct answer presents a complete solution. Choose two.)

- A. on: [push, pull_request]
- B. on:
schedule:
- cron: '*/*15 * * * *'
- C. on:
branches:
- 'main'
- D. on:

- env:
 - 'prod'
 - 'qa'
 - 'test'
- E. on:
 - push:
 - branches:
 - main
 - release:
 - types:
 - created
- F. on: [push, commit]

Answer: B

Explanation:

To automatically trigger a workflow, use on to define which events can cause the workflow to run.

You can define single or multiple events that can trigger a workflow, or set a time schedule. You can also restrict the execution of a workflow to only occur for specific files, tags, or branch changes.

[A] push and pull_request are both events that can trigger a workflow.

Note: Using multiple events

You can specify a single event or multiple events. For example, a workflow with the following on value will run when a push is made to any branch in the repository or when someone forks the repository:

on: [push, fork]

If you specify multiple events, only one of those events needs to occur to trigger your workflow. If multiple triggering events for your workflow occur at the same time, multiple workflow runs will be triggered.

[C] on.schedule

You can use on.schedule to define a time schedule for your workflows.

Reference:

<https://docs.github.com/en/actions/reference/workflows-and-actions/workflow-syntax>

<https://docs.github.com/en/actions/reference/workflows-and-actions/events-that-trigger-workflows>

NEW QUESTION # 13

You installed specific software on a Linux self-hosted runner. You have users with workflows that need to be able to select the runner based on the identified custom software. Which steps should you perform to prepare the runner and your users to run these workflows? (Choose two.)

- A. Configure the webhook and network to enable GitHub to trigger workflow.
- B. Create the group custom-software-on-linux and move the runner into the group.
- C. Inform users to identify the runner based on the group.
- D. Add the label custom-software to the runner.
- E. Add the label linux to the runner.

Answer: C,D

Explanation:

Once the runner is properly configured and labeled, users should be informed to select the specific runner by identifying the label or group name when defining the runner in their workflows.

Adding a custom label (like custom-software) to the runner makes it easier for users to select the runner in their workflows by using the runs-on key, which allows them to choose this specific runner based on its label.

NEW QUESTION # 14

Which choices represent best practices for publishing actions so that they can be consumed reliably? (Each correct answer presents a complete solution. Choose two.)

- A. commit SHA
- B. organization name
- C. tag
- D. repo name

- E. default branch

Answer: A,C

Explanation:

Security practices for writing workflows and using GitHub Actions features.

You can help mitigate this risk by following these good practices:

[B] Pin actions to a full-length commit SHA

Pinning an action to a full-length commit SHA is currently the only way to use an action as an immutable release. Pinning to a particular SHA helps mitigate the risk of a bad actor adding a backdoor to the action's repository, as they would need to generate a SHA-1 collision for a valid Git object payload. When selecting a SHA, you should verify it is from the action's repository and not a repository fork.

[D] Pin actions to a tag only if you trust the creator

Although pinning to a commit SHA is the most secure option, specifying a tag is more convenient and is widely used. If you'd like to specify a tag, then be sure that you trust the action's creators.

The 'Verified creator' badge on GitHub Marketplace is a useful signal, as it indicates that the action was written by a team whose identity has been verified by GitHub. Note that there is risk to this approach even if you trust the author, because a tag can be moved or deleted if a bad actor gains access to the repository storing the action.

Reference:

<https://docs.github.com/en/actions/reference/security/secure-use>

NEW QUESTION # 15

How can a workflow deploy mitigate the risk of multiple workflow runs that are deploying to a single cloud environment simultaneously? (Each correct answer presents part of the solution.

Choose two.)

- A. Set the concurrency in the deployment job to 1.
- **B. Specify a concurrency scope in the workflow.**
- C. Pass the mutex into the deployment job.
- D. Configure the mutex setting in the environment.
- **E. Specify a target environment in the deployment job.**
- F. Reference the mutex in the task performing the deployment.

Answer: B,E

Explanation:

[D] GitHub Actions now supports a concurrency key at both the workflow and job level that will ensure that only a single run or job is in progress.

concurrency

Use concurrency to ensure that only a single job or workflow using the same concurrency group will run at a time.

Example: Using concurrency and the default behavior

The default behavior of GitHub Actions is to allow multiple jobs or workflow runs to run concurrently. The concurrency keyword allows you to control the concurrency of workflow runs.

Reference:

<https://github.blog/changelog/2021-04-19-github-actions-limit-workflow-run-or-job-concurrency/>

<https://docs.github.com/en/actions/reference/workflows-and-actions/workflow-syntax#concurrency>

<https://github.com/marketplace/actions/actions-mutex>

NEW QUESTION # 16

As a developer, you are designing a workflow and need to communicate with the runner machine to set environment variables, output values used by other actions, add debug messages to the output logs, and other tasks. Which of the following options should you use?

- A. environment variables
- **B. workflow commands**
- C. enable debug logging
- D. composite run step
- E. self-hosted runners

Answer: B

Explanation:

Workflow commands for GitHub Actions

You can use workflow commands when running shell commands in a workflow or in an action's code.

About workflow commands

Actions can communicate with the runner machine to set environment variables, output values used by other actions, add debug messages to the output logs, and other tasks.

Most workflow commands use the echo command in a specific format, while others are invoked by writing to a file.
