Fortinet FCP - Google Cloud Security 7.6 Administrator Sample Questions (Q20-Q25):

NEW QUESTION # 20

Refer to the exhibit.

An administrator is troubleshooting network connectivity issues between two VMs deployed in Google Cloud. One VM is a FortiGate located in the subnet "wan" that is part of the VPC "e-commerce". The other VM is a Windows server located in subnet "servers", which is also in the "e-commerce" VPC. What are two reasons you cannot ping the Windows server from FortiGate? (Choose two.)

- A. Add a Google Cloud firewall rule to allow ICMP traffic inbound to the Windows firewall VM.
- B. The default Google Cloud firewall policy does not allow this traffic.
- C. ICMP traffic is blocked between Google Cloud subnets by default.
- D. The Windows firewall is blocking the traffic.

Answer: A,D

Explanation:

Google Cloud firewall rules are stateful and, by default, do not allow ICMP traffic; you must explicitly allow ICMP inbound traffic to the Windows VM.

The Windows VM's own firewall might block ICMP traffic, preventing ping responses.

NEW QUESTION # 21

An administrator wants to use the FortiGate automation stitch feature to quarantine compromised hosts. Which native Google Cloud service should the administrator integrate with FortiGate to achieve this?

- A. Google Cloud Interconnect
- B. Google Cloud IAM
- C. Google Cloud App Engine
- D. Google Cloud Run functions

Answer: D

Explanation:

Google Cloud Run allows you to run serverless containerized functions that can be triggered by FortiGate automation stitches to perform actions such as quarantining compromised hosts. It is the native service best suited for automating responses in cloud environments.

NEW QUESTION # 22

Google Cloud network services offer vast functionality and inter-connectivity between the cloud and on-premises networks. Which three additional functions does FortiGate offer when deployed in Google Cloud to complement the native services offered by Google Cloud? (Choose three.)

- A. Secure SD-WAN with application visibility

- B. OSPF over IPsec
- C. Web filtering
- D. SSL VPN
- E. SSL inspection

Answer: A,D,E

Explanation:

FortiGate provides SSL VPN capabilities for secure remote access.

It offers SSL inspection to decrypt and inspect encrypted traffic for threats.

FortiGate supports Secure SD-WAN with deep application visibility and control, enhancing network performance and security beyond native Google Cloud services.

NEW QUESTION # 23

Refer to the exhibit.

[pid 9006]: forwardrule fgt-forwarding-rule is updated to next hop fgt-target2-vpm successfully.
==== gcpd ha failover exit ====

```

An administrator is troubleshooting an issue when a high-availability (HA) failover occurs.

Which conclusion can you draw from the debug output?

- A. The health check has successfully updated the internal custom route to forward all internal traffic to 172.16.1.3.
- B. Both cluster members are located in the same zone.
- C. The HA cluster is accessible using HTTPS on 34.68.13.24 and 34.66.4.139.
- D. The HA cluster is deployed using the software-defined network (SDN) connector.

Answer: A

Explanation:

The debug output shows the internal route being updated and moved to the new next hop (172.16.1.3), indicating the health check and failover process successfully redirected internal traffic to the active HA node.

NEW QUESTION # 24

Your organization has decided to deploy a high-availability (HA) cluster. One key requirement of the deployment is to support configuration synchronization.

Which three deployment types should be considered? (Choose three.)

- A. Active-passive HA using software-defined networking (SDN)
- B. Active-passive HA using passthrough load balancers
- C. Active-active HA using auto scaling
- D. Active-passive HA using FGSP

Answer: A,B,D

Explanation:

These three deployment types support configuration synchronization between HA cluster members, which is critical for maintaining consistent state and seamless failover.
