2026 100% Free SAA-C03–Updated 100% Free Latest Braindumps Ppt | SAA-C03 Latest Exam Labs

What's more, part of that Prep4sureExam SAA-C03 dumps now are free: https://drive.google.com/open?id=1OPgcGoj67WU1psyXYsDsdaALof-QKPYa

The Amazon SAA-C03 certification examination is an essential component of professional development, and passing this Amazon SAA-C03 test can increase career options and a rise in salary. Nonetheless, getting ready for the AWS Certified Solutions Architect - Associate (SAA-C03) exam may be difficult, and many working professionals have trouble locating the Amazon SAA-C03 practice questions they need to succeed in this endeavor.

The Amazon SAA-C03 exam consists of multiple-choice and multiple-response questions, which are designed to test your understanding of AWS services and how they are used to design and deploy solutions in the cloud. SAA-C03 Exam is timed and lasts for 130 minutes. To pass the exam, you must achieve a minimum score of 720 out of 1000.

Amazon SAA-C03 Latest Exam Labs, New SAA-C03 Exam Experience

We have prepared our SAA-C03 training materials for you. They are professional practice material under warranty. Accompanied with acceptable prices for your reference, all our materials with three versions are compiled by professional experts in this area more than ten years long. Moreover, there are a series of benefits for you. So the importance of SAA-C03 Actual Test is needless to say. If you place your order right now, we will send you the free renewals lasting for one year. All those supplements are also valuable for your SAA-C03 practice exam.

Amazon SAA-C03 exam is designed to test the knowledge and skills of individuals who want to become certified Amazon AWS Solutions Architects. AWS Certified Solutions Architect - Associate certification is highly valued in the IT industry and is recognized globally. The Amazon SAA-C03 Certification Exam validates the candidate's proficiency in designing and deploying scalable, highly available, and fault-tolerant systems on the AWS platform.

Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q726-Q731):

NEW QUESTION # 726
[Design Resilient Architectures]
An ecommerce company is running a seasonal online sale. The company hosts its website on Amazon EC2 instances spanning multiple Availability Zones. The company wants its website to manage sudden traffic increases during the sale.
Which solution will meet these requirements MOST cost-effectively?

- A. Create an Auto Scaling group that is large enough to handle peak traffic load. Stop half of the Amazon EC2 instances. Configure the Auto Scaling group to use the stopped instances to scale out when traffic increases.
- B. Configure an Auto Scaling group to scale out as traffic increases. Create a launch template to start new instances from a preconfigured Amazon Machine Image (AMI).

- C. Create an Auto Scaling group for the website. Set the minimum size of the Auto Scaling group so that it can handle high traffic volumes without the need to scale out.
- D. Use Amazon CloudFront and Amazon ElastiCache to cache dynamic content with an Auto Scaling group set as the origin. Configure the Auto Scaling group with the instances necessary to populate CloudFront and ElastiCache. Scale in after the cache is fully populated.

Answer: B

Explanation:
The solution that meets the requirements of high availability, resiliency, and minimal operational effort is to use AWS Transfer for SFTP and an Amazon S3 bucket for storage. This solution allows the company to securely transfer files over SFTP to Amazon S3, which is a durable and scalable object storage service. The company can then modify the application to pull the batch files from Amazon S3 to an Amazon EC2 instance for processing. The EC2 instance can be part of an Auto Scaling group with a scheduled scaling policy to run the batch operation only at night. This way, the company can save costs by scaling down the EC2 instances when they are not needed. The other solutions do not meet all the requirements because they either use Amazon EFS or Amazon EBS for storage, which are more expensive and less scalable than Amazon S3, or they do not use a scheduled scaling policy to optimize the EC2 instances usage. Reference := AWS Transfer for SFTP Amazon S3 Amazon EC2 Auto Scaling

NEW QUESTION # 727
A company uses an on-premises network-attached storage (NAS) system to provide file shares to its high performance computing (HPC) workloads. The company wants to migrate its latency-sensitive HPC workloads and its storage to the AWS Cloud. The company must be able to provide NFS and SMB multi-protocol access from the file system.
Which solution will meet these requirements with the LEAST latency? (Select TWO.)

- A. Attach the EC2 instances to an Amazon FSx for Lustre file system.
- B. Attach the EC2 instances to an Amazon FSx for OpenZFS file system.
- C. Attach the EC2 instances to an Amazon FSx for NetApp ONTAP file system.
- D. Deploy compute optimized EC2 instances into a partition placement group.
- E. Deploy compute optimized EC2 instances into a cluster placement group.

Answer: C,E

Explanation:
A cluster placement group is a logical grouping of EC2 instances within a single Availability Zone that are placed close together to minimize network latency. This is suitable for latency-sensitive HPC workloads that require high network performance. A compute optimized EC2 instance is an instance type that has a high ratio of vCPUs to memory, which is ideal for compute-intensive applications. Amazon FSx for NetApp ONTAP is a fully managed service that provides NFS and SMB multi-protocol access from the file system, as well as features such as data deduplication, compression, thin provisioning, and snapshots. This solution will meet the requirements with the least latency, as it leverages the low-latency network and storage performance of AWS.
Reference:
1 explains how cluster placement groups work and their benefits.
2 describes the characteristics and use cases of compute optimized EC2 instances.
3 provides an overview of Amazon FSx for NetApp ONTAP and its features.

NEW QUESTION # 728
A company has a service that reads and writes large amounts of data from an Amazon S3 bucket in the same AWS Region. The service is deployed on Amazon EC2 instances within the private subnet of a VPC. The service communicates with Amazon S3 over a NAT gateway in the public subnet. However, the company wants a solution that will reduce the data output costs.
Which solution will meet these requirements MOST cost-effectively?

- A. Provision a dedicated EC2 NAT instance in the public subnet. Configure the route table for the private subnet to use the elastic network interface of this instance as the destination for all S3 traffic.
- B. Provision a dedicated EC2 NAT instance in the private subnet. Configure the route table for the public subnet to use the elastic network interface of this instance as the destination for all S3 traffic.
- C. Provision a second NAT gateway. Configure the route table for the private subnet to use this NAT gateway as the destination for all S3 traffic.
- D. Provision a VPC gateway endpoint. Configure the route table for the private subnet to use the gateway endpoint as the route for all S3 traffic.

Answer: D

Explanation:
it allows the company to reduce the data output costs for accessing Amazon S3 from Amazon EC2 instances in a VPC. By provisioning a VPC gateway endpoint, the company can enable private connectivity between the VPC and S3. By configuring the route table for the private subnet to use the gateway endpoint as the route for all S3 traffic, the company can avoid using a NAT gateway, which charges for data processing and data transfer. VPC Endpoints Pricing

NEW QUESTION # 729

A company has an application that runs on a single Amazon EC2 instance. The application uses a MySQL database that runs on the same EC2 instance. The company needs a highly available and automatically scalable solution to handle increased traffic.
Which solution will meet these requirements?

- A. Deploy the application to EC2 instances that run in an Auto Scaling group behind an Application Load Balancer. Create an Amazon Aurora Serverless MySQL cluster for the database layer.
- B. Deploy the application to EC2 instances that are configured as a target group behind an Application Load Balancer. Create an Amazon RDS for MySQL cluster that has multiple instances.
- C. Deploy the application to EC2 instances that are configured as a target group behind an Application Load Balancer. Create an Amazon ElastiCache (Redis OSS) cluster that uses the MySQL connector.
- D. Deploy the application to EC2 instances that run in an Auto Scaling group behind an Application Load Balancer. Create an Amazon Redshift cluster that has multiple MySQL-compatible nodes.

Answer: A

Explanation:
Amazon Aurora Serverless is a fully managed, MySQL-compatible database that automatically scales based on demand and provides high availability. Combining this with EC2 Auto Scaling and an Application Load Balancer achieves both application and database high availability and scalability.
Reference Extract:
"Aurora Serverless automatically starts up, shuts down, and scales capacity based on your application's needs, providing a cost-effective, highly available database solution." Source: AWS Certified Solutions Architect - Official Study Guide, Aurora Serverless and Scaling section.

NEW QUESTION # 730

[Design Resilient Architectures]
A company hosts a three-tier ecommerce application on a fleet of Amazon EC2 instances. The instances run in an Auto Scaling group behind an Application Load Balancer (ALB) All ecommerce data is stored in an Amazon RDS for ManaDB Multi-AZ DB instance The company wants to optimize customer session management during transactions The application must store session data durably Which solutions will meet these requirements? (Select TWO)

- A. Deploy an Amazon ElastiCache for Redis cluster to store customer session information
- B. Deploy an Amazon Cognito user pool to manage user session information
- C. Turn on the sticky sessions feature (session affinity) on the ALB
- D. Use an Amazon DynamoDB table to store customer session information
- E. Use AWS Systems Manager Application Manager in the application to manage user session information

Answer: A,C

Explanation:
https://aws.amazon.com/caching/session-management/
