You will become accustomed to and familiar with the free demo for VMware 2V0-17.25 Exam Questions. Exam self-evaluation techniques in our 2V0-17.25 desktop-based software include randomized questions and timed tests. These tools assist you in assessing your ability and identifying areas for improvement to pass the VMware VMware Cloud Foundation 9.0 Administrator exam.

VMware 2V0-17.25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> Deploy, Configure, and Operate VMware Cloud Foundation (VCF): This section of the exam measures the skills of VCF Administrators and goes in-depth into deploying, configuring, and managing VMware Cloud Foundation. The deployment portion covers identifying deployment models, configuring private cloud environments, and setting up workload domains and networking. The management objectives focus on lifecycle operations such as fleet management, identity and role-based access, licensing, certificate handling, and importing existing vCenters. Operations are assessed through capabilities like monitoring health, logs, networks, and storage, along with creating dashboards, configuring alerts, and ensuring compliance. The automation portion evaluates skills in using VCF Automation for multi-tenancy, provider networking, content libraries, governance policies, and extensibility to automate business processes. It also includes knowledge of deploying Supervisor-based services within Cloud Foundation.
Topic 2	<ul style="list-style-type: none"> Plan and Design the VMware by Broadcom Solution: This section of the exam measures the skills of Solution Designers and emphasizes the ability to plan and design VMware by Broadcom solutions. Although no testable objectives are defined here, it reinforces the importance of architectural planning and design considerations for large-scale cloud deployments.
Topic 3	<ul style="list-style-type: none"> VMware Cloud Foundation Fundamentals: This section of the exam measures the skills of Private Cloud Engineers and covers the basic building blocks of VMware Cloud Foundation. It includes the vision and use cases for private cloud, along with the value it provides to businesses. Candidates are expected to understand compute fundamentals such as deploying and managing vCenter, ESXi, clusters, and virtual machines. Storage fundamentals include configuring vSphere storage, setting up vSAN clusters, applying storage policies, and understanding resilience options. Networking fundamentals are also assessed, with a focus on configuring connectivity, fabrics, routing, and network services in a VMware environment.
Topic 4	<ul style="list-style-type: none"> IT Architectures, Technologies, Standards: This section of the exam measures the skills of Cloud Architects and focuses on understanding the broader context of IT architectures, common technologies, and industry standards. While it does not have testable objectives, it sets the foundation for how VMware Cloud Foundation aligns with enterprise cloud strategies.

VMware Cloud Foundation 9.0 Administrator Sample Questions (Q11-Q16):

NEW QUESTION # 11

A cluster is experiencing frequent host disconnects. Which troubleshooting steps or checks might help identify the root cause?

- A. Reviewing vpxd.log and hostd.log for errors
- B. Confirming that firewall ports for management traffic are open
- C. Testing DNS resolution for forward and reverse lookups
- D. Deleting the cluster and re-adding all hosts manually

Answer: A,B,C

Explanation:

Checking logs (A), ensuring correct firewall rules (B), and verifying DNS resolution (D) are key. Deleting and recreating the cluster (C) is rarely the first step and may cause more disruption.

NEW QUESTION # 12

An administrator has been tasked with deploying a new instance of VMware Cloud Foundation (VCF) in a dark site. How should the administrator download VCF binaries prior to starting the installation?

- A. Use Broadcom Downloads
- B. Use SDDC Manager
- C. Use the VCF Installer
- D. Use the VCF Download Tool

Answer: D

Explanation:

For dark site (air-gapped) deployments, VMware Cloud Foundation requires the use of the VCF Download Tool to retrieve the required software bundles from a connected system before transferring them into the isolated environment.

The VCF 9.0 Installation Guide specifies:

"For deployments in disconnected or air-gapped environments, use the VCF Download Tool on a connected system to download required bundles and then transfer them to the target environment."

* The VCF Installer (A) consumes bundles but does not download them.

* SDDC Manager (B) can download bundles only in connected mode.

* Broadcom Downloads (D) is the source portal, but not the supported workflow tool for preparing offline repositories.

Therefore, the correct method for dark site deployments is to use the VCF Download Tool.

NEW QUESTION # 13

A large corporation recently experienced a power outage at one of its primary data centers resulting in service disruption for customers in that region. An administrator is tasked to assess the current infrastructure and propose a plan to improve resiliency.

Current configuration:

- Single-site vSAN Express Storage Architecture (ESA) cluster 12 hosts
- Cluster resource utilization (CPU, memory, and storage) is under 30%

Which solution would improve resiliency and minimize service disruption in data center outages with a recovery point objective (RPO) of zero without requiring additional hosts?

- A. Deploy VMware Live Recovery to maintain an identical copy in a secondary site.
- B. Convert existing production workload to a RAID-1 storage policy.
- C. Configure the twelve ESX hosts into six fault domains.
- **D. Relocate six ESX hosts to another data center and configure a vSAN Stretched Cluster.**

Answer: D

Explanation:

The VCF 9.0 Design Guide highlights that for resiliency across sites with RPO = 0, the recommended approach is a vSAN Stretched Cluster. Documentation states: "Stretched clusters provide site-level resilience by mirroring data across two fault domains (sites). In the event of a full site outage, workloads remain available with no data loss (RPO = 0)." Relocating six hosts to another site creates the two fault domains required for vSAN Stretched Cluster.

NEW QUESTION # 14

Which three VMware NSX Manager credentials are managed by VMware Cloud Foundation (VCF)? (Choose three.)

- A. backup
- **B. admin**
- C. administrator
- **D. audit**
- **E. root**
- F. administrator@vsphere.local

Answer: B,D,E

Explanation:

In VMware Cloud Foundation 9.0, the Account and Password Management table explicitly lists the NSX Local Manager local appliance accounts whose passwords are managed (updated/remediated) through VCF Operations UI or API. Under NSX Local Manager, the accounts shown as managed are:

audit - "Update or remediate by using the VCF Operations UI or API."

admin - "Update or remediate by using the VCF Operations UI or API."

root - "Update or remediate by using the VCF Operations UI or API."

These three correspond exactly to options A (admin), C (audit), and E (root).

NEW QUESTION # 15

Which statement describes a Container Storage Interface (CSI) in vSphere Supervisor?

- **A. It is a plug-in that allows providers to expose storage as persistent storage.**
- B. It is a plug-in that is only used for clusters which require cloud native storage.
- C. It is a plug-in that only works with vSphere object storage.
- D. It is a plug-in that is required for ephemeral storage.

Answer: A

Explanation:

The VMware Cloud Foundation 9.0 and vSphere with Tanzu documentation describes the Container Storage Interface (CSI) as follows:

"The vSphere CSI driver allows vSphere storage to be exposed as persistent storage to containerized applications running on Kubernetes clusters. The driver implements the Kubernetes CSI specification and enables dynamic provisioning, attach/detach, and snapshot operations for persistent volumes." Key points from the documentation:

* CSI is not limited to vSphere object storage (A). It works with vSAN, VMFS, NFS, and other vSphere-supported datastores.

* Its purpose is to provide persistent storage (B), so containerized workloads have data that outlives pod lifecycles.

* CSI is not restricted to "cloud native storage only" (C); it is the standard interface for Kubernetes persistent storage.

* CSI is not used for ephemeral storage (D); ephemeral storage is provided by local container runtimes and does not require CSI. Therefore, the correct description is that CSI is a plug-in that allows providers to expose storage as persistent storage to Kubernetes workloads running in vSphere Supervisor clusters.
