Before purchasing NCP-DB-6.10 prep torrent, you can log in to our website for free download. During your installation, NCP-DB-6.10 exam torrent hired dedicated experts to provide you with free online guidance. During your studies, NCP-DB-6.10 exam torrent also provides you with free online services for 24 hours, regardless of where and when you are, as long as an email, we will solve all the problems for you. At the same time, if you fail to pass the exam after you have purchased NCP-DB-6.10 prep torrent, you just need to submit your transcript to our customer service staff and you will receive a full refund.

Our NCP-DB-6.10 test prep attaches great importance to a skilled, trained and motivated workforce as well as the company's overall performance. Adhere to new and highly qualified NCP-DB-6.10 quiz guide to meet the needs of customer, we are also committed to providing the first -class after-sale service. There will be our customer service agents available 24/7 for your supports; any request for further assistance or information about NCP-DB-6.10 Exam Torrent will receive our immediate attention. And you can contact us online or send us email on the NCP-DB-6.10 training questions.

NCP-DB-6.10 Exam Dumps Collection, NCP-DB-6.10 Dumps Discount

If you don't want to waste much time on preparing for your exam, Nutanix NCP-DB-6.10 exam braindumps files will be a shortcut for you. Good exam materials make you twice the result with half the effort. Our Nutanix NCP-DB-6.10 exam braindumps cover many questions and answers of the real test so that you can be familiar with the real test question. When you attend Nutanix NCP-DB-6.10 Exam, it is easy for you to keep good mood and control your finishing time.

Nutanix Certified Professional - Database Automation (NCP-DB) v6.10 Sample Questions (Q45-Q50):

NEW QUESTION # 45

A development team has requested that an administrator provide them a copy of the production Finance database. The business requires that any financial data is masked before going into development.

How should the administrator create a clone with masked data for the development environment?

- A. 1. Create a masking script on the source DB VM, Dev VM or SW Profile VM.
2. Create the clone from the Time Machine and define the post-clone option with the full path/name of the masking script.
- B. From the Time Machine, create a clone and paste the masking commands in the pre-clone field of the Pre-Post Commands section.
- C. 1. Create a script to mask the data.
2. Create the clone from the Time Machine and define the post-clone option with the full path/name of the masking script.
- D. From the Time Machine, create a clone and paste the masking commands in the post-clone field of the Pre-Post Commands section.

Answer: A

Explanation:

According to the Nutanix Database Automation (NCP-DB) course, the Pre-Post Commands section allows the administrator to specify custom scripts that can be executed before or after the clone operation. The masking script can be created on any of the VMs that have access to the source database, such as the source DB VM, the Dev VM, or the SW Profile VM. The script should contain the commands to mask the sensitive data in the Finance database, such as replacing the real values with dummy values or encrypting the data. The administrator can then create the clone from the Time Machine and define the post-clone option with the full path and name of the masking script. This will ensure that the script is executed after the clone is created, and the data is masked before it is available for the development team. The other options are not correct, as they either use the wrong field (pre-clone instead of post-clone), or do not specify where to create or store the masking script.

NEW QUESTION # 46

An administrator needs to perform patching on a MongoDB server cluster within an NDB environment.

How should the administrator accomplish this task?

- A. Perform a rolling upgrade, applying the patch to the primary member first, followed by the secondary members.
- B. Perform a rolling upgrade, applying the patch to the secondary members first, followed by the primary member.
- C. Disable the replica set while patching.
- D. Apply the patch to all nodes at once.

Answer: B

Explanation:

The administrator should perform a rolling upgrade, applying the patch to the secondary members first, followed by the primary member, to accomplish the task of patching a MongoDB server cluster within an NDB environment. A rolling upgrade is a method of applying patches or updates to a cluster without downtime or interruption of service. The administrator can use the NDB patching feature to perform a rolling upgrade on a MongoDB server cluster, which consists of a primary member and one or more secondary members that form a replica set. The NDB patching feature allows the administrator to select the software profile version, the database parameters profile, and the network profile for the patching operation.

NEW QUESTION # 47

Why are ports 3205 and 3260 important when working with Era?

- A. These ports facilitate SMB connections
- B. These ports facilitate iSCSI connections
- C. These ports facilitate CIFS connections
- D. These ports facilitate NFS connections

Answer: B

Explanation:

Ports 3205 and 3260 are important when working with Era because they must be open on the Era server and all Controller VMs (CVMs) to facilitate iSCSI connections. Specifically, port 3205 is used for iSCSI redirection. Please be careful of routing iSCSI traffic, as it could impact performance.

NEW QUESTION # 48

An administrator needs to provision a 3-node MSSQL Server AG with the following configuration:

- Two database server VMS including the primary replica on a local site
- A third database server VM on a remote site

How many IP addresses will the network at each site require?

- A. 1 Cluster VIP and 1 Listener IP on the local site
1 Listener IP on the local site
2 IPs in the local site and 1 on the remote site for the database server nodes
- B. 2 Cluster VIP and 1 listener IP on the local site
- C. 1 Cluster VIP and 1 Listener IP on the local site
1 Cluster VIP and 1 Listener IP on the remote site
2 IPs in the local site and 1 on the remote site for the database server nodes
- D. 1 Cluster VIP and 1 listener IP on the remote site
2 IPs in the local site and 1 on the remote site for the database server nodes
1 Cluster VIP on the local site
1 Cluster VIP and 1 Listener IP on the remote site
2 IPs in the local site and 1 on the remote site for the database server nodes

Answer: C

Explanation:

When setting up a 3-node MSSQL Server AG with two database server VMs on a local site and a third database server VM on a remote site, the network at each site will require the following IP addresses:

1 Cluster VIP and 1 Listener IP on the local site.

1 Cluster VIP and 1 Listener IP on the remote site.

2 IPs in the local site and 1 on the remote site for the database server nodes.

This configuration ensures that each node in the cluster has a unique IP address, and each cluster and listener also has a unique IP address. This is necessary for the proper functioning of the cluster and to ensure that all nodes can communicate with each other and with clients.

NEW QUESTION # 49

An administrator needs to restore databases provisioned with a shared disk configuration on Windows Storage Spaces. What happens when NDB runs the restore operation?

- A. NDB performs Tail Log backup to backup any remaining logs.
- B. NDB replaces the source volume with the snapshot volume.
- C. NDB copies the DB files to be restored to the source volume.
- D. NDB restores the disk that are associated with the database.

Answer: D

Explanation:

When an administrator needs to restore databases provisioned with a shared disk configuration on Windows Storage Spaces in Nutanix Database Service (NDB), the restore operation focuses on the disks associated with the database. Windows Storage Spaces provides a virtualized storage layer, and NDB manages the restoration by reverting or recovering the specific disks that host the database files and logs. This ensures that the database is restored to its previous state using the snapshot or backup data, while preserving the shared disk configuration integrity. NDB does not replace the source volume or perform additional operations like tail log backups unless explicitly configured.

NEW QUESTION # 50

.....

Compared with those practice materials which are to no avail and full of hot air, our NCP-DB-6.10 guide tests outshine them in every aspect. If you make your decision of them, you are ready to be thrilled with the desirable results from now on. The passing rate of our NCP-DB-6.10 Exam Torrent is up to 98 to 100 percent, and this is a striking outcome staged anywhere in the world. They are appreciated with passing rate up to 98 percent among the former customers. So they are in ascendant position in the

market.
