The VMware 2V0-11.25 certification exam is one of the hottest and career-oriented VMware Cloud Foundation 5.2 Administrator (2V0-11.25) exams. With the VMware Cloud Foundation 5.2 Administrator (2V0-11.25) exam you can validate your skills and upgrade your knowledge level. By doing this you can learn new in-demand skills and gain multiple career opportunities. To do this you just need to enroll in the VMware 2V0-11.25 Certification Exam and put all your efforts to pass this important VMware 2V0-11.25 Exam Questions. However, you should keep in mind that to get success in the VMware Cloud Foundation 5.2 Administrator (2V0-11.25) exam is not an easy task.

To avail of all these VMware 2V0-11.25 certification exam benefits you need to enroll in VMware 2V0-11.25 certification exam and pass it with good scores. Are you ready for this? If your answer is right then you do not need to go anywhere. Just download VMware 2V0-11.25 Dumps questions and start preparing today.

VMware 2V0-11.25 Latest Training | 2V0-11.25 Online Training

Exam candidates are susceptible to the influence of ads, so our experts' know-how is impressive to pass the 2V0-11.25 exam

instead of making financial reward solely. We hypothesize that you fail the exam after using our 2V0-11.25 learning engine we can switch other versions for you or give back full refund. In such a way, our 2V0-11.25 Exam Questions can give you more choices to pass more exams and we do put our customers' interest as the first thing to consider.

VMware Cloud Foundation 5.2 Administrator Sample Questions (Q84-Q89):

NEW QUESTION # 84

An administrator has deployed a new VMware Cloud Builder appliance using the downloaded OVF file.

While attempting to use the VMware Cloud Builder interface, the administrator discovers that no connection can be established to the appliance.

Which three configuration errors may have occurred? (Choose three.)

- A. BGP routing misconfiguration.
- **B. Incorrect Static IP configuration.**
- **C. VLAN misconfiguration.**
- **D. Incorrect DNS settings or inaccessible DNS servers.**
- E. Incorrect Dynamic IP configuration.
- F. Incorrect NTP settings or inaccessible NTP servers.

Answer: B,C,D

Explanation:

A VLAN misconfiguration could prevent proper network connectivity, particularly if the appliance is not in the correct VLAN or if there is a misalignment in network segmentation.

Incorrect DNS settings or inaccessible DNS servers can prevent the VMware Cloud Builder appliance from being able to resolve hostnames, leading to connection issues.

Incorrect Static IP configuration would result in the appliance being unreachable because it won't have the correct IP address or network configuration to communicate with other components.

NEW QUESTION # 85

Which is the appropriate first action to take to resolve dropped network packets on an ESXi host?

- A. Migrate VMs to another data store
- **B. Check physical network switch configuration**
- C. Increase the CPU and memory allocation for VMs
- D. Enable Storage I/O Control

Answer: B

Explanation:

Dropped network packets are often caused by misconfigurations or issues at the physical network layer.

Checking the physical network switch configuration is the first step to ensure that the network settings, such as VLANs, uplinks, and port configurations, are correctly set up. This ensures proper connectivity and traffic flow for the ESXi host and the VMs.

NEW QUESTION # 86

A newly added ESXi host is not able to communicate with the vCenter Server.

What three steps should an administrator take to diagnose and resolve this issue? (Choose three.)

- A. Use the vSphere Client to review the host's network settings
- **B. Ensure that the management network is correctly configured and reachable**
- C. Check the license on the ESXi host
- **D. Verify the network configuration on the ESXi host**
- **E. Restart the management agents on the ESXi host**

Answer: B,D,E

Explanation:

Verifying the network configuration on the ESXi host ensures that the host is correctly configured for network communication with the vCenter Server.

The management network must be properly configured and reachable from the ESXi host to communicate with the vCenter Server. Restarting the management agents on the ESXi host can resolve issues related to communication between the ESXi host and vCenter Server, as sometimes the agents might become unresponsive.

NEW QUESTION # 87

A cloud administrator recently deployed a new VI workload domain. As part of the initial VI domain creation, the administrator created a new SSO domain. However, they reconsidered and now want the domain to use the same SSO domain as the management domain.

How can the VI domain be changed from a dedicated SSO domain to sharing the SSO domain with the management domain?

- A. From the SDDC Manager console, use the rsautil command to add the VI workload domain to the management domain SSO ring.
- B. From the Management Domain vCenter Server instance, use the rsautil command to add the VI workload domain to the management domain SSO ring.
- C. The vSphere SSO domain cannot be changed once it has been deployed and a new VI workload domain that is part of the Management SSO domain must be created, and workloads migrated.
- D. From the VI Workload Domain vCenter Server instance, use the rsautil command to join the management domain SSO ring.

Answer: C

Explanation:

Once the vSphere Single Sign-On (SSO) domain is set up for a workload domain, it cannot be changed. If you need the VI workload domain to use the same SSO domain as the management domain, you must create a new VI workload domain that is part of the management domain's SSO ring, and then migrate the workloads to the new domain.

NEW QUESTION # 88

How do virtual machine (VM) storage policies in a VMware vSphere environment contribute to optimizing resource utilization, ensuring data availability, and meeting application-specific requirements?

- A. By defining and enforcing storage requirements, such as performance, availability, and redundancy
- B. By regulating and optimizing storage traffic between virtual machines
- C. By guaranteeing storage IOPs for a particular virtual machine
- D. By streamlining the process of automating virtual machine backups

Answer: A

Explanation:

VM storage policies let you specify requirements like performance tiers, redundancy levels, and availability SLA, and vSphere enforces these rules against underlying storage capability profiles to optimize resource usage and meet application needs.

NEW QUESTION # 89

.....

A calm judgment is worth more than a thousand hasty discussions. I know that when you choose which our 2V0-11.25 exam materials to buy, it will be very tangled up. This is a responsible performance for you. But you can't casually make a choice because of tangle. And our 2V0-11.25 Study Materials won't let you regret. You can just free download the demos of the 2V0-11.25 practice guide to have a check our quality.
