NEW QUESTION # 94
What does the symcf g discover command do when upgrading Solutions Enabler on a Linux host1?

- A. Builds the SYMAPI database
- B. Verifies that the SE daemons have been stopped
- C. Identifies the running SE version
- D. Creates backups of the configuration directories

Answer: C

Explanation:
Step by Step Comprehensive Detailed Explanation:
When upgrading Solutions Enabler (SE) on a Linux host, the symcfg discover command plays a crucial role in preparing for the upgrade. Its primary function in this context is to:
* Identify the running SE version:Before proceeding with the upgrade, it's essential to know the current version of Solutions Enabler installed on the host. The symcfg discover command gathers information about the existing SE environment, including the version number. This information is used to determine the appropriate upgrade path and ensure compatibility.
Why other options are incorrect:
* B. Verifies that the SE daemons have been stopped:While stopping SE daemons is a necessary step before the upgrade, it's not the function of the symcfg discover command.
* C. Builds the SYMAPI database:The SYMAPI database is typically built during the initial installation or after a fresh discovery.
* D. Creates backups of the configuration directories:Backups are important, but they are usually handled separately as part of the upgrade process, not by the symcfg discover command itself.

* Dell Solutions Enabler 10.0.0 Installation Guide:This guide provides detailed instructions for upgrading Solutions Enabler on different operating systems, including Linux. It explains the steps involved and the role of the symcfg discover command in the upgrade process. You can find this document on the Dell Support website by searching for "Solutions Enabler Installation Guide."

NEW QUESTION # 95
A TimeFinder SnapVX snapshot of a Storage Group was created with a time-to-live setting of seven days Fourteen days after snapshot creation, a query shows that the snapshot still exists What is a possible reason for this issue?

- A. Snapshot has one or more linked targets
- B. Snapshot was created in NoCopy mode
- C. Snapshot was not manually terminated
- D. D. Reserved Capacity limit was exceeded

Answer: A

Explanation:
Step by Step Comprehensive Detailed Explanation:
TimeFinder SnapVX snapshots in PowerMax can be configured with a time-to-live (TTL) setting. This setting automatically deletes the snapshot after the specified time period has elapsed. However, there are certain situations where a snapshot might persist beyond its TTL:
* Linked Targets:If a snapshot has one or more linked targets associated with it, the snapshot will not be automatically deleted even if the TTL expires. This is because the linked targets depend on the snapshot for their data. The snapshot will remain available until all linked targets are deleted or unlinked.
Why other options are incorrect:
* B. Snapshot was not manually terminated:The TTL setting is designed to automatically delete the snapshot; manual termination is not required.
* C. Snapshot was created in NoCopy mode:The NoCopy mode affects how the snapshot is initially created, not its TTL behavior.
* D. Reserved Capacity limit was exceeded:The Reserved Capacity limit applies to the overall storage space used by snapshots, not the TTL of individual snapshots.
References and documents of Dell's public documentation for PowerMax Operate v.2:
* Dell Solutions Enabler 10.0.0 TimeFinder SnapVX CLI User Guide:This guide provides detailed information about SnapVX features and functionalities, including the time-to-live setting and how it interacts with linked targets. You can find this document on the Dell Support website by searching for
"Solutions Enabler TimeFinder SnapVX CLI User Guide."
