PECB ISO 21502 Lead Project Manager Exam Sample Questions (Q33-Q38):

NEW QUESTION # 33

Scenario:

Mallebare is an American company which designs and manufactures gaming accessories. Apart from keyboards, mice, and controllers, the company also manufactures high-quality headsets for which it is widely known. Recently, upon the request of numerous gamers, the company decided to manufacture mousepads too.

For this project, Luke, the CEO of the company, assigned Ross, a senior designer of the company, as the project manager, whereas Smith, a senior engineer, was assigned as project sponsor. In addition, Luke stated the project should be complete within three months, as the company is aiming to promote the mousepads in a major gaming tournament. Lastly, Luke required them to utilize the guidelines of ISO 21502 to manage the project.

Initially, Ross mobilized the team and held a meeting with them to discuss and develop the project plan. He asked the team members to ensure that major functional aspects of the project are covered in the project plan and to identify any issue that might arise throughout the project life cycle. Ross explained that this request comes as a result of the tight deadline of the project and the team must develop a concise plan. Ross added that the plan will not be changed in any circumstance and will be followed in detail. Following that, Ross and the team discussed the engagement of all relevant stakeholders throughout the project. Ross used a power/interest matrix to categorize all stakeholders in four different groups, where the tournament organizers were categorized as stakeholders with low interest but high power in the project. On the other hand, end users, the gamers, were categorized as stakeholders with high interest and high power in the project, so the project team created a survey to determine their needs and requirements.

Moreover, Ross was aware of the importance of effective communication for the success of the project.

Therefore, he developed a communication plan which would ensure that each individual involved in the project gets the right information in a timely manner. The plan indicated that ad hoc discussions would be conducted in more complex and personal cases, whereas notes and text messages would be used for transmitting simple and factual information. Ross claimed that this model had been successful in previous projects conducted by the company because it allows faster processing of information and includes natural use of language. In addition, Ross determined that a relationship among project team members needs to be established to ensure productive work.

Question:

Based on which communication model did Ross develop the communication plan? Refer to the last paragraph of scenario 6.

- A. Effectiveness of communication channels
- B. Gulf of execution and evaluation
- C. Cross-cultural communication

Answer: A

Explanation:

The correct answer is B. Effectiveness of communication channels . Ross selected communication methods according to the nature and complexity of the information being transmitted. He planned ad hoc discussions for complex and personal matters, and notes or text messages for simple and factual information. This reflects the principle that communication channels differ in richness, speed, feedback capability, personal focus, and suitability for the message. Richer channels, such as direct discussion, are more effective when information is ambiguous, sensitive, complex, or requires immediate feedback. Leaner channels, such as notes or text messages, are suitable for simple, factual, routine, or low-risk information. Ross's explanation that the model allows faster processing of information and uses natural language directly supports the idea of channel effectiveness. Option A is incorrect because the scenario does not focus on cultural interpretation, language barriers, or cross-cultural norms. Option C is also incorrect because the gulf of execution and evaluation concerns user interaction and usability, not the selection of communication media in project communication planning.

Reference topics: communication planning, communication channels, channel effectiveness, information complexity, stakeholder communication.

NEW QUESTION # 34

What is the purpose of the planning quality phase?

- A. To ensure compliance with the determined quality requirements and applicable standards
- B. To determine if the requirements are being met and take actions to improve unsatisfactory performance
- C. To define the applicable standards and quality requirements regarding a project and its outcomes

Answer: C

Explanation:

The correct answer is A . The purpose of planning quality is to define the applicable standards and quality requirements for the project and its outcomes. Quality planning establishes what "acceptable quality" means before work is performed. It identifies relevant standards, customer requirements, regulatory requirements, acceptance criteria, quality metrics, inspection needs, test approaches, responsibilities, and control methods.

This allows the team to build quality into the work rather than discovering quality problems late. Option B describes quality assurance or quality management activities focused on ensuring that work is being performed in accordance with defined quality requirements and standards. Option C describes quality control, where results are checked, nonconformities are identified, and corrective action is taken to improve unsatisfactory performance. Planning quality is therefore the front-end definition phase: it clarifies the quality basis against which project work and outcomes will later be assessed. Without effective quality planning, the project team may deliver outputs that are technically complete but unacceptable to the customer or performing organization. Reference topics: quality planning, quality standards, quality requirements, acceptance criteria, project outcomes.

NEW QUESTION # 35

Arka, a manufacturing company, has initiated a project together with two other companies. Jim, who is the CEO of Arka, has suggested that the project board consist of representatives from each company instead of only Arka's personnel in order to increase transparency. However, the representatives of the other companies disagreed, claiming that this would not be compliant with ISO 21502 guidelines. Instead, they are suggesting that they outsource the function of the project board to avoid conflicts of interest. Is this in compliance with ISO 21502?

- A. Yes, ISO 21502 suggests that companies outsource their project board function in order to avoid conflicts of interest when working in a joint project
- B. No, according to ISO 21502, the three companies should unanimously choose only one company whose representatives will act as the project board and not include representatives from all companies
- C. No, ISO 21502 states that the project board can include representatives from each company if they are working in a joint project

Answer: C

Explanation:

The correct answer is C . The suggestion to reject representatives from each company and outsource the project board function is not aligned with the ISO 21502 governance logic. In a joint project involving multiple organizations, the project board can include representatives from each participating company. This supports transparency, balanced decision-making, accountability, stakeholder confidence, and alignment among the organizations contributing resources, authority, funding, expertise, or acceptance responsibilities.

A joint project has multiple organizational interests, so excluding some companies from the project board could reduce trust and create weak governance. Option A is incorrect because ISO 21502 does not require outsourcing the project board to avoid conflicts of interest. Outsourcing governance could actually create accountability ambiguity unless carefully justified and authorized. Option B is also incorrect because selecting only one company's representatives would not necessarily reflect the shared nature of the project. In joint governance, the board should be structured to represent the participating organizations appropriately while maintaining clear authority, decision rules, escalation paths, and conflict-resolution mechanisms. The uploaded source question explicitly presents this situation as a joint project governance issue.

Reference topics: joint project governance, project board composition, representation, transparency, conflict of interest, governance accountability.

NEW QUESTION # 36

Among others, how can the project oversight be done?

- A. By ensuring that the project plan is being followed in detail
- B. Through ad hoc escalations and interventions
- C. By appointing more than one project manager

Answer: B

NEW QUESTION # 37

When can the project benefits be realized?

- A. Only after the post-project activities have been completed

- B. During the project, at the end of the project, or after the project has closed
- C. At the end of the project only

Answer: B

Explanation:

The correct answer is C . Project benefits can be realized during the project, at the end of the project, or after the project has closed. The timing depends on the project type, delivery approach, output usability, transition strategy, and benefit realization plan. In some projects, early outputs may be used before full completion, allowing benefits to begin during delivery. In other projects, benefits emerge at handover or immediately after final acceptance. In many cases, especially transformation, infrastructure, technology, or organizational- change projects, benefits are realized after closure when outputs are embedded into operations and outcomes become measurable. Options A and B are too restrictive because they assume only one benefit-realization timing. ISO 21502-aligned thinking distinguishes deliverables, outputs, outcomes, and benefits, and recognizes that value may occur at different points. This is why benefit ownership, measurement, reporting, and post-project activities are important. The project manager may help enable benefits, but the sponsoring organization or operational owner often continues benefit realization after the project has closed.

Reference topics: benefit realization, project outcomes, post-project activities, project closure, value creation, benefit timing.

NEW QUESTION # 38

.....

One of features of ISO-21502-Lead-Project-Manager training materials of us is that we can help you pass the exam just one time, and we also pass guarantee and money back guarantee for you fail to pass the exam.
