Valid CLO-002 Exam Labs - CompTIA Cloud Essentials+ Certification Exam Realistic Test Practice

These practice exams are solely designed to help you achieve CLO-002 certification on the first attempt. The mock exam simulator helps you get through every topic inside out and you get overall better grades. This is because you have hands-on the most updated and most reliable CompTIA CLO-002 Questions created under the supervision of 90,000 CompTIA professionals.

CompTIA Cloud Essentials+ Certification Exam Sample Questions (Q254-Q259):

NEW QUESTION # 254

An IT department is considering a move to the cloud and wants to maintain control over the virtual machines. Which of the following deployment models should the department propose?

- A. SaaS
- B. IaaS
- C. ITaaS
- D. ITaaS

Answer: B

Explanation:

IaaS provides virtualized computing resources over the internet, such as virtual machines (VMs), storage, and networks. This model allows the IT department to maintain control over the virtual machines, as they can configure, manage, and scale the VMs according to their needs. It provides more flexibility compared to other models like PaaS (Platform as a Service) or SaaS (Software as a Service), where the cloud provider handles more of the infrastructure management.

NEW QUESTION # 255

An external cloud service provider has been chosen by a financial company to deliver some capabilities that used to be performed in-house. Which of the following would provide the BEST amount of coverage to the financial company by way of continually asserting that there is an acceptable security posture being achieved by the service provider?

- A. Ensure that the service provider aligns to an industry standard, such as ISO 27000 series or another regulatory compliance framework and request that they self-monitor annually.
- B. Perform a penetration test every 6 to 12 months and mandate that any unacceptably high issues or risks are mitigated.
- C. Perform a risk assessment annually and mandate that any unacceptably high risks are mitigated.
- D. Define required security service levels, agree on security evaluation criteria, and perform regular compliance checks based on the service levels and evaluation criteria.

Answer: D

NEW QUESTION # 256

Which of the following cloud service models can an organization use to provision on demand custom-built servers to run in-house developed applications?

- A. SaaS
- B. IaaS
- C. BPaaS
- D. PaaS

Answer: B

NEW QUESTION # 257

A project manager is interested in the notification process a CSP follows after discovering a breach of customer data. Which of the following is MOST likely to provide the necessary information?

- A. Access controls
- B. Incident response policy
- C. Service level agreement
- D. Communication plans

Answer: C

Explanation:

A service level agreement (SLA) is a contract between a cloud service provider (CSP) and a customer that defines the level of service, performance, availability, and responsibilities of both parties¹. An SLA may also include the notification process a CSP follows after discovering a breach of customer data, such as the time frame, the communication channels, the content and format of the notification, and the remediation actions². A communication plan is a document that outlines the objectives, strategies, and tactics for communicating with different stakeholders, but it may not specify the details of the breach notification process³. An incident response policy is a set of guidelines and procedures for responding to security incidents, such as identifying, containing, analyzing, and recovering from them, but it may not be shared with the customer by the CSP⁴. Access controls are the mechanisms and policies that regulate who can access what resources and data in a cloud environment, but they are not related to the breach notification process⁵. Reference:
