## WGU Secure Software Design (KEO1) Exam Sample Questions (Q111-Q116):

### NEW QUESTION # 111

Which secure software design principle states that it is always safer to require agreement of more than one entity to make a decision?

- **A. Separation of Privileges**
- B. Psychological Acceptability
- C. Total Mediation
- D. Least Privilege

**Answer: A**

### NEW QUESTION # 112

Which software control test examines the internal logical structures of a program and steps through the code line by line to analyze the program for potential errors?

- A. Reasonableness testing
- B. Dynamic testing
- C. Black box testing
- **D. White box testing**

**Answer: D**

Explanation:

White box testing, also known as clear box testing, glass box testing, transparent box testing, and structural testing, is a method of software testing where the internal structure, design, and coding of the software are tested to verify the flow of input-output and to improve the design, usability, and security. It involves looking at the structures that are internal to the system, with the tester having knowledge of the internal workings of the product. This type of testing is concerned with examining the internal logical structures of the program and is typically performed by stepping through the code line by line to analyze the program for potential errors, which aligns with the description of the control test in question.

### NEW QUESTION # 114

Which security assessment deliverable identifies possible security vulnerabilities in the product?

- A. List of third-party software
- **B. Threat profile**
- C. Metrics template
- D. SDL project outline

**Answer: B**

Explanation:

A threat profile is a security assessment deliverable that identifies possible security vulnerabilities in a product. It involves a systematic examination of the product to uncover any weaknesses that could potentially be exploited by threats. The process typically includes identifying the assets that need protection, assessing the threats to those assets, and evaluating the vulnerabilities that could be exploited by those threats. This deliverable is crucial for understanding the security posture of a product and for prioritizing remediation efforts.

References: The importance of a threat profile in identifying security vulnerabilities is supported by various security resources. For instance, Future Processing's blog on vulnerability assessments outlines the steps involved in identifying security vulnerabilities, which align with the creation of a threat profile<sup>1</sup>. Additionally, UpGuard's article on conducting vulnerability assessments further emphasizes the role of identifying vulnerabilities as part of the security assessment process<sup>2</sup>.

### NEW QUESTION # 115

Which secure coding practice involves clearing all local storage as soon as a user logs off for the night and will automatically log a user out after an hour of inactivity?

- **A. Session management**
- B. System configuration
- C. Access control
- D. Communication security

**Answer: A**

Explanation:

The practice of clearing all local storage when a user logs off and automatically logging a user out after an hour of inactivity falls under the category of Session Management. This is a security measure designed to prevent unauthorized access to a user's session and to protect sensitive data that might be stored in the local storage. By clearing the local storage, any tokens, session identifiers, or other sensitive information are removed, reducing the risk of session hijacking or other attacks. The automatic logout feature ensures that inactive sessions do not remain open indefinitely, which could otherwise be exploited by attackers.

References: The information aligns with the secure coding practices outlined by the OWASP Foundation<sup>1</sup>, and is supported by common practices in web development for managing sessions and local storage<sup>2</sup>.
